REVIEW OF METAL LITERATURE

An Annotated Survey of Articles, Technical Papers and Reports Appearing in Engineering, Scientific and Industrial Journals and Books, Here and Abroad, Prepared at the Center for Documentation and Communication Research, Western Reserve University, Cleveland, Ohio.

Volume 15

1958

CUSHING - MALLOY, INC., ANN ARBOR, MICHIGAN, 1959

PREFACE

The A.S.M. Review of Metal Literature is a monthly feature of *Metals Review*, published by the American Society for Metals and distributed to its members. The present volume is a collection of the installments published in *Metals Review* from January through December 1958. It is the fifteenth volume in a series that began in 1944.

In most instances, the annotations are not intended to serve as a substitute for a reading of the articles listed. They are brief abstracts designed to indicate the scope and content of the article so that the reader may determine whether it is something he wants to read in its entirety. In other words, they are indicative rather than informative abstracts.

The table of contents lists the main headings into which the A.S.M. Review of Metal Literature is subdivided, together with secondary subdivisions indicating the scope of the main heading. The main sections are designated by capital letters, and individual annotations are identified by the appropriate capital letter preceded by a serial number.

The method of classifying the annotations into subject subdivisions is based upon the "ASM-SLA Metallurgical Literature Classification, International (Second) Edition," published by the American Society for Metals in 1958. Each annotation is likewise followed by code symbols which refer to the subdivisions and schedules of the ASM-SLA Classification.

An understanding of this coding system, however, is not essential to the use of this volume of the Review of Metal Literature, which is accompanied by a complete subject index starting on page 1189. Since the annotations are classified primarily by processes and properties, the subject index has been prepared with the emphasis primarily on materials. Subheads and cross-references are included in sufficient detail to permit the location of articles on any specific subject related to the metal industry. Indexing is based on the content of the article and not merely on the title.

In using the book, if the primary interest is in the broad field of corrosion, or foundry practice, or heat treatment, turn immediately to the respective section as given in the table of contents. If the main interest is in aluminum alloys, or copper, or cast iron, turn to the corresponding heading in the subject index. If interest lies in specific aspects of foundry practices, or a particular type of heat treatment, these broad processes will be found indexed and subdivided in the subject index. An author index is also provided and a list of addresses of the journals and periodicals from which the literature references are taken.

Section G. SECONDARY MECHANICAL WORKING—FORMING AND MACHINING 252

Presswork in general; shearing; stamping; drawing; impact and cold extrusion; bending; stretch forming; heading; roll forming; thread rolling; spinning; bulging; die sinking; machining (mechanical); grinding; finish machining; flame and arc cutting; finish forming; special machining methods; applied mechanics of forming and machining (stress analysis)

Section H. POWDER METALLURGY 294

Powder production; powder properties; mixing and blending; molding or compacting; sintering; post-sintering operations; fiber metallurgy

Section J. HEAT TREATMENT 310

Homogenization; austenitizing; annealing; normalizing; patenting; quenching; precipitation hardening; case hardening; tempering; residual stress control; heating and cooling methods; other carbon diffusion processes; surface alterations; hardenability

Section K. ASSEMBLING AND JOINING 344

Arc welding; gas welding; resistance welding; thermit welding; forge welding; other welding processes; soldering; brazing; process control; bonding metals to nonmetals; adhesive joining; mechanical assembling

Section L. CLEANING, COATING AND FINISHING. 403

Mechanical cleaning and polishing; chemical cleaning and polishing; electrochemical cleaning and polishing; chemical conversion coating; diffusion coating; dip coating; electroplating; electroforming; anodic coating; cathodic oxide coating; cladding or bonding; metal spraying; coating by weld deposition; coating by vapor deposition; painting and organic coating; ceramic coating (vitreous enameling); coating by chemical reduction; other methods

Section M. METALLOGRAPHY, CONSTITUTION AND PRIMARY STRUCTURE 471

Specimen preparation; microscopy; diffraction methods; other techniques; phase diagrams; atomic and molecular structures; crystal structures; primary microstructures; macrostructure

Section N. TRANSFORMATIONS AND RESULTING STRUCTURES 539

Diffusion; nucleation; grain growth; recovery; recrystallization; diffusionless transformations; precipitation; austenite formation and decomposition (Fe-C system); other eutectoid reactions; superlattice formation (order-disorder); other solid-state reactions; liquid-solid reactions; liquid-liquid reactions; gas-solid reactions; gas-liquid reactions

Section P. PHYSICAL PROPERTIES AND THEIR MEASUREMENT.... 621

Mass and volume; thermal; thermodynamics and kinetics; chemical kinetics; electrical and electrochemical; magnetic; radiation properties (electromagnetic); nuclear

Section Q. MECHANICAL PROPERTIES AND TESTS..... 694

Elastic properties; anelastic properties; miscellaneous plastic properties; plastic deformation mechanism; stresses; fracture mechanism; tensile properties and tests; compression properties and tests; hardness and hardness tests; torsion properties and tests; shear properties and tests; creep properties and tests; bend properties and tests; impact properties and tests; fatigue properties and tests; damping properties and tests; wear properties and tests; other properties and tests

Section R. CORROSION..... 851

Mechanism of corrosion; corrosive effects; atmospheric corrosion; by waters; by chemicals, inorganic; by chemicals, organic; by soils; preventive measures; tests

Section S. INSPECTION AND CONTROL..... 926

Sorting and identification; composition analysis; statistical analysis and control; flaw detection; size, thickness and mass measurement; surface roughness; temperature measurement and control; process control and measurement; radiation detection and measurement; miscellaneous service testing (life testing); standard practice and specifications; calibration

Section T. METAL PRODUCTS AND PARTS..... 983

Automotive; marine; railroad; aircraft; structures; mining and oil field equipment; chemical processing equipment; electrical and electronic components; ordnance material (excluding explosives); agricultural equipment; civil engineering equipment; tools and hardware; machine parts; arts and crafts; consumer goods; nuclear reactor components

Section W. PLANT EQUIPMENT..... 1017

Plant installations; power generation and distribution; materials handling; general service equipment; ore and raw material preparation; fuel distillation and gasification; furnaces and equipment for primary metallurgy; melting and refining furnaces and equipment; casting; ingot and slab preparation; forging; rolling; forming and shaping; machine tools; powder metal processing; heat treating furnaces; other heat treating equipment; welding, brazing and soldering; mechanical assembling; mechanical cleaning and finishing; chemical and electrochemical cleaning and finishing; other cleaning and finishing

Section X. INSTRUMENTATION—LABORATORY AND CONTROL EQUIPMENT 1057

Size, thickness and mass; chemical laboratory; surface properties; thermal properties; electrical properties; nuclear properties; elastic and anelastic properties; mechanical properties; corrosion; radiation detection; optics and microscopy; metallography; photography and other visual aids; sorting and identification; atmosphere and humidity; flaw detection; temperature measurement; electricity; magnetism; pressure; rate, time and flow; computers and business machines; communication

ADDRESSES OF PUBLICATIONS 1067

AUTHOR INDEX 1081

SUBJECT INDEX 1189

SECTION A

GENERAL METALLURGICAL

1-A. Scrap Control in Nonferrous Foundries. Martin G. Dietl. *Foundry,* v. 85, Nov. 1957, p. 106-109.
(A8d; EG-a38, RM-n)

2-A. Molybdenum—a Versatile Metal. G. L. Miller. *Industrial Chemist,* v. 33, Oct. 1957, p. 509-518. (CMA)

History, occurrence, ore production, processing, production of different forms, applications, and physical and corrosion resistant properties. The total known molybdenum reserves of the U. S. would last 100 years at the present rate of exploitation. (A general; Mo)

3-A. Science for Electroplaters. Pt. 30. Acidification of Cyanide Waste. L. Serota. *Metal Finishing,* v. 55, Nov. 1957, p. 72-75.

Acid treatment method based on the volatility of hydrogen cyanide when cyanide waste is treated (decomposed) by an acid. (A8d, L17)

4-A. Radiation and Metals. A. E. Williams. *Metal Industry,* v. 91, Oct. 25, 1957, p. 359-362.

Industrial applications of radioisotopes; metal penetration by gamma rays; effects of radiation on solid matter; changes in elastic properties; study of porous metal coatings; thickness gages using isotopes; application to galvanizing wire and vacuum metallizing. 3 ref.
(A general, S general, Q21, 2-67; 14-63)

5-A. (Italian.) **Determination of Foundry Costs.** Eraldo Lotti. *Fonderia Italiana,* v. 6, Sept. 1957, p. 355-360.

Cost analysis method in use for many years in FIAT foundries.
(A4s, E general)

6-A. (Italian.) **Quality Alloy Cast Irons.** Giorgio Giacomelli. *Fonderia Italiana,* v. 6, Sept. 1957, p. 361-366.

Characteristics imparted to cast iron by Ni, Cr, Mo, V, Ti and Cu; methods of making additions; compositions, structures and mechanical properties of high-strength, corrosion, abrasion and heat resistant alloy cast irons. (A general, 2-60; CI, *Ni, Cr, Mo, V, Ti, Cu*)

7-A. (Norwegian.) **Safety and Sanitation in Welding.** *Teknisk Ukeblad,* v. 104, Apr. 4, 1957, p. 268-270.

Hazards and damage possible in different methods of welding; new protective measures.
(A7p, K general)

8-A. Fabrication of Uranium and Its Alloys. E. C. W. Perryman. *Canadian Mining and Metallurgical Bulletin,* v. 50, Sept. 1957, p. 574-579.

Effect of thermal cycling and radiation on dimensional and mechanical properties of U. Casting, rolling, extruding and heat treating U and its alloys. 6 ref. (A general; U)

9-A. Zirconium and Tantalum. G. L. Miller. *Chemical and Process Engineering,* v. 38, Oct. 1957, p. 389-390. (CMA)

(A general, T29, 17-57; Zr, Ta)

10-A. Industrial Hygiene of Metals of Recent Industrial Importance. H. H. Schrenk. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 87A-88A.

Toxicity of boron and boron compounds, Zr, Mo, Ge, Cb, V, Ce, Cs, La, Pr, Nd, Y. Methods of determination of boron in atmosphere and in biological specimens.
(A7; B, Zr, Mo, Ge, Cb, V, Cs, La, Pr, Nd, Y)

11-A. Dust and Fume Control. J. C. Somers. *Mechanical Engineering,* v. 79, Nov. 1957, p. 1022-1024.

(A7, A8a)

12-A. Vacuum Metallurgy. R. C. Bertossa. *Mechanical Engineering,* v. 79, Nov. 1957, p. 1039-1041.

(A general; 1-73)

13-A. Rare Earth Metals. Their Properties and Industrial Application. Felix Trombe. *Metal Treatment and Drop Forging,* v. 24, Oct. 1957, p. 421-424. (CMA)

(A general; EG-g)

14-A. Trends in the Major Non-Ferrous Metals. P. F. Whelan. *Mine and Quarry Engineering,* v. 23, Oct. 1957, p. 440-442.

Brief statistical survey of production of Cu, Pb, Zn and Al over last 50 years. (A4p; Cu, Pb, Zn, Al)

15-A. Past and Future Uranium Utilization. R. L. Doan. *Mining Engineering,* v. 9, Sept. 1957, p. 1009-1112.

(A general, 17-57; U)

16-A. Beryllium. G. L. Miller. *Nuclear Power,* v. 2, Oct. 1957, p. 438-440.

Fabrication, properties and applications. 21 ref. (A general; Be)

17-A. Mag Moves Ahead. *Steel,* v. 141, Nov. 18, 1957, p. 192-203.

Excerpts from papers on casting, extrusion, welding, brazing and pressing presented at the Magnesium Association convention.
(A general; Mg)

18-A. (English.) **Production Problems of Titanium and Its Alloys. Pt. I.** R. L. P. Berry and E. Swainson. *Tidskrift for Kjemi, Bergvesen og Metallurgi,* v. 17, June 1957, p. 87-92. (CMA)

Effects of impurities, transformation, alloying and heat treating on the metallurgy of Ti, methods of reducing Ti, apparatus for melting it. (A general; Ti)

19-A. (German.) **Development of Carbide Techniques in East Germany.** Curt Agt. *Neue Hütte,* v. 2, Sept. 1957, p. 537-544.

Tough, hard and wear resistant carbides; tantalum carbide; titanium carbide; technology, properties, cutting capacity, applications. 15 ref. (A general; Ta, Ti, 6-69)

20-A. (German.) **Heat Resisting and Nonscaling Sintered Materials in Austria.** Friedrich Benesovsky and Richard Kieffer. *Neue Hütte,* v. 2, Sept. 1957, p. 545-554.

Titanium carbide, molybdenum silicide and boride-base materials; Mo and Mo alloys as high-temperature materials. 29 ref.
(A general, 2-12; Mo, 6-69, 6-70)

21-A. (German.) **Organization of Materials and Production in Management.** Werner Schütte, Ulrich Sabass, Hans-Heinrich von Lintig and Anton Schütz. *Stahl und Eisen,* v. 77, Aug. 22, 1957, p. 1146-1160.

(A5)

22-A. (Polish.) **Development of Transformer Steel.** M. Markuszewicz. *Hutnik,* v. 24, July-Aug. 1957, p. 258-266.

Grades of the transformer steel plate; izotropic plates; textured plates; problems of plate utilization; products made in Poland. 56 ref.
(A general; SGA-r, AY)

23-A. (Polish.) **Production and Magnetic Application of Soft Iron-Nickel Alloys in Soviet Union.** W. J. Skotnikow. *Hutnik,* v. 24, July-Aug. 1957, p. 282-289.

Classification of soft magnetic Fe-Ni alloys; technology of production process; uses, trends in Soviet research.
(A general, P16; Fe, Ni, SGA-n)

24-A. (Romanian.) **Recovery of Tellurium From Nonferrous Wastes.** R. Ripan, Gh. Marcu and N. Pascu. *Studii si Cercetari de Chimie,* v. 4, Jan-June 1956, p. 7-11.

Survey of products from the different phases of the Romanian nonferrous industry for recoverable Te. A new method for the preparation of Te by a wet process with acetic acid. (A11d; Te)

25-A. (Russian.) **New Grades of Low-Alloy Steel.** M. V. Pridantsev and G. L. Livshits. *Metallurg,* v. 2, July 1957, p. 18-19.

Chemical composition of 24 grades of low-alloy steel available in U.S.S.R.; advantages over carbon steel. (A general, S22; AY)

26-A. Impact of Automation. *American Machinist,* v. 101, Oct. 21, 1957, p. 166-180.

Reviews extent of automation in metalworking industry.
(A general, 18-74)

27-A. Boron Is a Toxicity Problem. W. H. Schechter. *Chemical and Engineering News,* v. 35, Dec. 2, 1957, p. 54-55.

(A7; B)

28-A.* Materials That Stand up When the Heat's On. J. Wambold and T. F. Frangos. *Design Engineering,* v. 3, Oct. 1957, p. 67-70.

Chemical composition; physical and mechanical properties of some cermets; processes of formation; sintering; densification of shape; applications. (A general; 6-70)

29-A. Cost Accounting Procedures for the Gray Iron Foundry. Pt. 2. Albert E. Grover. *Foundry,* v. 85, Dec. 1957, p. 94-97.

Procedures for handling plant assets. (A5, A4s; CI-n)

30-A. Electric Furnace Fumes Vacuum Cleaned to Prevent Air Pollution. *Industrial Heating,* v. 24, Sept. 1957, p. 1750-1754.

Electric furnace fumes and smoke are trapped by system of dacron bags and automatic dust collectors. (A8a, W17s)

31-A. What to Do About Metal Fires. *Iron Age,* v. 180, Nov. 21, 1957, p. 128-129.

(A7p)

32-A. Treatment and Re-Use of Mill Scale Wastes to Conserve Water and Abate Pollution. Grant A. Pettit. *Iron and Steel Engineer,* v. 34, Sept. 1957, p. 144-151.

Facilities and operation for treatment of mill scale wastes from roughing and finishing rolling mills. Sedimentation, flocculation, and clarifications system permits removal of 176,000 to 206,000 lb. of scale a day and recovery of water for reuse in mills and other processes. (A8, W23)

33-A. The Steel Industry in India—Yesterday, Today and Tomorrow. E. T. Warren. *Iron and Steel Engineer,* v. 34, Nov. 1957, p. 80-89.

(A4; ST)

34-A.* High-Boron Alloy Steels. T. H. Middleham, J. R. Rait and E. W. Colbeck. *Iron and Steel Institute, Journal,* v. 187, Sept. 1957, p. 1-14.

Techniques for production of B-Al steels containing up to about 4.75% B which can be forged, rolled or extruded and production of B-Fe alloys with up to 6% B in form of castings; methods of manufacture, physical and mechanical properties, constitution and application of these B steels in thermal nuclear reactors. 23 ref. (A general, D general, Q general; AY, *Al, B*)

35-A. Raw Materials for the American Iron and Steel Industry. James C. O. Harris. *Journal of Metals,* v. 9, Dec. 1957, p. 1529-1532.

Steel consumption; pig iron requirements; iron ore supplies; beneficiated ore; coke requirements; scrap needs; effect of new steelmaking techniques; scrap substitutes. 11 ref.
(A4, D general; ST, Fe, RM-j43, RM-p, RM-n)

36-A. Science for Electroplaters. Pt. 30. Acidification of Cyanide Waste. L. Serota. *Metal Finishing,* v. 55, Nov. 1957, p. 72-75.

(A8b, L17)

37-A.* Research on Titanium. H. D. Kessler. *Metal Industry,* v. 91, Nov. 15, 1957, p. 415-417.

Determination of oxygen by means of the Pt bath vacuum fusion technique; solution treatment; formability and tensile properties.
(A general, S11, J27a, Q23q; Ti)

38-A.* Recent Statistics on Metallurgical Education. Michael B. Bever. *Metal Progress,* v. 72, Nov. 1957, p. 101-106.

While numbers of B.S. degrees in metallurgy do not now reach the postwar peak from G.I. training, the current number (545 in 1955-56) is a higher proportion of all engineering degrees. It is predicted that the figure will reach 750 in the near future and possibly 1000 within a few more years. M.S. degrees have been about 160 in each of the last three years. Ph.D. degrees show a steady increase from 42 in 1948-49, to 76 in 1955-56. (A3)

39-A. Tailings Disposal at Braden Copper Co. R. W. Jigins. *Mining Engineering,* v. 9, *AIME Transactions,* v. 208, Oct. 1957, p. 1135-1140.

Disposal of tailings from copper concentrater in Chile. (A8d; Cu)

40-A. Titanium and Zirconium, Twin Metals of the Atomic Age. K. C. Li. *Mining Engineering,* v. 9, Nov. 1957, p. 1245-1249. (CMA)

History, processing (by the Kroll, iodide, calcium hydride, electrolytic and Gross methods), cost and raw materials of Ti. 3 ref.
(A general, C general; Ti, Zr)

41-A. Metal Selector. *Steel,* v. 141, Oct. 28, 1957, p. 169-178.

Selection of proper metals for jobs considers composition, forming or casting properties, mechanical properties; application of wrought and cast Cu alloys, wrought and cast Al alloys, stainless steels, ferrous casting alloys, Zn die-casting alloys and Ti and Mg alloys. (A general; 17-57)

42-A. Summary of Existing Knowledge on the Zirconium-Uranium Alloys (10 to 50 w/o Uranium). W. L. Mudge, Jr. Westinghouse Atomic Power Division. *U. S. Atomic Energy Commission,* WAPD-MDM-20, Dec. 8, 1954, 19 p. (CMA)

Properties and fabrication. 23 ref. (A general; Zr. U)

43-A.* Vacuum-Metallurgical Research Gives Industry a Glimpse Into the Future. R. C. Bertossa. *Welding Journal,* v. 36, Nov. 1957, p. 483s-489s.

Applications in designing process equipment for the chemical, petroleum, paper-pulp and aircraft industries. Role of vacuum in casting, purification, degassing, heat treatment, cladding, brazing, melting and joining. 6 ref. (A general, 1-73)

44-A. (Dutch.) **Review of the Behavior of Nickel Alloys, in Particular the Nickel-Chromium Alloys at High Temperature.** C. Vollers. *Metalen,* v. 12, Aug. 31, 1957, p. 302-310. (Pt. 1 in *Metalen,* v. 12, Sept. 15, 1957, p. 342-349.)

Characteristics of heat resistant Ni alloys, particularly Ni-Cr; fatigue, creep tensile properties, deformation, corrosion and weldability. Applications in gas turbines, motors, cast iron molds, extrusion tools, springs, nuts, bolts for high temperature, conveyors in annealing ovens, furnace parts. 19 ref.
(A general, 17-57; SGA-h, Ni, *Cr*)

45-A. (French.) **Present Uses and Possible Applications of Metal Molybdenum.** J. Fabry and P. Gousseland. *Documentation Métallurgique,* no. 27, July-Sept. 1956, p. 223-233. (CMA)

6 ref. (A general, 17-57; Mo)

46-A. (French.) **Influence of Aluminum Content of Zinc Alloys on Their Properties With Respect to Pressure Casting.** L. A. J. Lodder and K. P. Scott. *Fonderie,* no. 139, Aug. 1957, p. 367-377.

Influence of Al on structural, mechanical and chemical properties of Zamak alloys; economic importance; review of previous research. Intergranular corrosion of Zn-Al alloys; steam and atmosphere corrosion tests. 19 ref.
(A general, E13; Zn, *Al*)

47-A. (French.) **Foundry Productivity.** Guy de Ghellinck. *Fonderie Belge,* no. 10, Oct. 1957, p. 247-252.

Comparison of productivity of ten Belgian foundries. (A5, E general)

48-A. (French.) **Calculation of Heat Loss by Conduction in a Cowper.** D. Sanna. *Institut de Recherche de la Sidérurgie,* v. A, no. 129, Oct. 1957, p. 1-16.

(9 ref. (A11e, W17m)

49-A. (French.) **Industrial Grades of Ferronickel and Their Principal Applications.** Jean A. Ternisien. *Métallurgie et la Construction Mécanique,* v. 89, Oct. 1957, p. 817-827.

(To be continued.) (A general, 17-57; Fe, Ni)

50-A. (German.) **Cast Iron With Spheroidal Graphite.** A. Hohmann. *Giesserei Praxis,* v. 75, Oct. 10, 1957, p. 436-437.

Definition; production; properties; advantages. (A general; CI-v)

51-A.* (German.) **Furnace Slag for Road Ballast.** Paul Huttemann. *Stahl und Eisen,* v. 77, Oct. 1957, p. 1436-1442.

Testing methods for strain on road building materials; comparison between natural rock and slag; relationship between chemical composition and mineralogical structure and elastic and plastic properties; determination of crushing degree; effect on properties of different structures. 6 ref. (A11c; RM-q)

52-A. (Italian.) **Iron. Pt. 2. Steel. Pt. 3. Recent Trends in Steelmaking.** Marco Savarese and Andrea Ciaccio. *Industria Mineraria,* v. 8, Aug. 1957, p. 545-560.

Historical review; recent trends in ore preparation and in manufacture of iron and steel; direct production of iron. (To be continued.)
(A2, D general; ST, CI)

53-A. (Norwegian.) **Deposits of Chromium Ore East of Roros.** Rolf Falck-Muus. *Tidsskrift for Kjemi, Bergvesen og Metallurgi,* v. 17, no. 5, 1957, p. 73-76.

Mineralogical description. Finds of peridotite minerals (e.g., olivine, enstatite, chromite, uwarowite, magnesite, talcum, and others such as serpentine and asbestos).
(A11a; Cr, RM-n)

54-A. (Book.) **Uranium in South Africa, 1946-1956.** 1029 p. 1957. Associated Scientific and Technical Societies of South Africa, P. O. Box 5907, Johannesburg, South Africa. $20.

(A general; U)

55-A. (Book.) **Making, Shaping, and Treating of Steel.** 732 p. 1957. 7th Edition. United States Steel Corp., Office Service-Stores, 525 William Penn Place, Pittsburgh 30, Pa. $7.50.

Comprehensive summary of present-day theory and practice covering all phases of iron and steel production from raw materials to finished products. (A general; ST)

56-A. (Book.) **First Nuclear Engineering and Science Congress, Selected Papers.** 2 v., 643 p. 1957. Pergamon Press, 122 East 55th St., New York 22, N. Y.

Covers U ores, U alloys and reactor materials. Papers of interest not previously covered as preprints abstracted separately.
(A general, W11p, 17-57; U)

57-A. Materials of Construction: Tin and Its Alloys. Robert M. MacIntosh. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1653-1657.

Recent literature on tin technology and applications. 237 ref.
(A general, 17-57; Sn)

58-A. Materials of Construction: Aluminum Alloys. R. L. Horst. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1578-1583.

Literature review of corrosion, design considerations and fabrication techniques, architectural applications in atomic energy field, in chemical processes, food, marine, packaging, petroleum, power industries, and in pressure vessels. 51 ref.
(A general, 17-57; Al)

59-A. Materials of Construction: Lead and Its Alloys. Edward J. Mullarkey. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1607-1611.

Technology and applications. 90 ref. (A general, 17-57; Pb)

60-A. Materials of Construction: Less Common Metals. E. M. Sherwood. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1612-1617.

Literature review on Zr, Hf, Mo, Cb, Ta, Te, Re and Cr as construction and engineering materials. 143 ref. (A general, 17-57; Zr, Hf, Mo, Cb, Ta, Re, Cr)

61-A. Materials of Construction: Nickel, Including High-Nickel Alloys. R. M. Fuller. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1618-1628.

Review of recent literature on technology and applications. 200 ref. (A general, 17-57; Ni)

62-A. Materials of Construction: Stainless Steels Including Other Ferrous Alloys. Walter A. Luce. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1643-1652.

Review of recent literature on technology and applications. 137 ref. (A general, 17-57; SS)

63-A. Are We Running Out of Metals. Eric A. Brandes. *Product Engineering,* v. 28, Sept. 1957, p. 36-37.

(A11a, A11b)

64-A. Zirconium Hazards Research. Progress Report No. 1 for Sept. 1, 1956 to Feb. 28, 1957. J. A. Herickes and P. A. Richardson. *U. S. Atomic Energy Commission, AECU-3554,* Feb. 28, 1957, 43 p. (CMA)

(A7p; Zr)

65-A. Stainless Steel and Titanium Sandwich Structures. W. J. Lewis, G. E. Faulkner and P. J. Rieppel. Battelle Memorial Institute, Titanium Metallurgical Laboratory, Report 79. *U. S. Office of Technical Services,* PB 121633, Aug. 1957, 29 p. (CMA)

(A general; Ti, SS, 7-59)

66-A. (French.) **Gallium, Metal of the Future.** *L'Industrie Chimique,* no. 482, Sept. 1957, p. 278.

101-A. Liquid Metals Technology. Pt. 1. *Chemical Engineering Progress Symposium Series,* v. 53, no. 20, 1957, 84 p. (Published by American Institute of Chemical Engineers.)

Articles abstracted separately.
(A general, 14-60)

102-A.* Manufacture and Availability of the Alkali Metals. Marshall Sittig. Paper from "Liquid Metals Technology", Pt. 1. Chemical Engineering Progress Symposium Series, p. 35-41.

Review of manufacturing processes for various alkaline metals and brief historical notes. Raw materials situation with regard to geographic location, ore processing, present manufacturing facilities in various countries of the world; future possibilities. 25 ref.
(A11a, A general; EG-e, 14-60)

103-A. A Century and a Half of Sodium Development. M. Schofield. *Chemical Products and Chemical News,* v. 20, Dec. 1957, p. 503-504.

Isolation of Na in 1807; development of manufacture; some current uses. (A general; Na)

104-A.* Developments in the Iron and Steel Industry During 1957. I. E. Madsen. *Iron and Steel Engineer,* v. 35, Jan. 1958, p. 139-185; 188-189.

Detailed analysis of production statistics; future trends, announced expansion plans for both American and foreign plants; raw materials; survey of new blast furnace, steelmaking, rolling and finishing techniques; furnaces and methods of control; mechanical and electrical innovations. (A4, D general, F23; ST)

105-A. Republic's Expansion Program Nears Completion. *Iron and Steel Engineer,* v. 35, Jan. 1958, p. 196-199.

Program will increase the annual ingot capacity of the Cleveland plant by 788,000 tons to 3,360,000 tons.
(A4p, D general; ST)

106-A. Fundamentals of Scale Model Experiments. W. O. Philbrook. *Journal of Metals,* v. 9, Oct. 1957, p. 1353-1358.

Problems and limitations in modeling and results obtainable from pilot-plant studies of complex metallurgical processes with application to heat transfer of solid patricles, fluid flow models, gasification of fuels, shaft, reverberatory and arc furnaces. 12 ref.
(A9j, A11e, D general)

107-A.* Design of Pyrometallurgical Pilot Plant. R. C. Buehl. *Journal of Metals,* v. 9, Oct. 1957, p. 1359-1362.

Design of scale pilot plants for study of entire processes. Pilot plant of electric arc, melting furnaces, blast furnaces, openhearth furnaces and converters are considered. (A9j, W17, W18, D general)

108-A. European Metallurgical Research—Fundamental to the Coal and Steel Community. F. Weston Starratt. *Journal of Metals,* v. 9, Oct. 1957, p. 1365-1366.

Report on metallurgical research program supported by authority of European Coal and Steel Community. (A9; ST)

109-A. Blast Furnace U. S. A. Pt. 3. From Falling Creek to Zug Island. M. O. Holowaty and C. M. Squarcy. *Journal of Metals,* v. 9, Oct. 1957, p. 1367-1372.

Historical account of conversion of furnaces from charcoal to bituminous and finally to coke. The expansion of the American iron and steel industry during the 19th and 20th centuries; evolution in furnace dimensions. 38 ref. (A2, D1)

110-A. "Araldite" and the Light Metals. P. A. Dunn. *Light Metals,* v. 20, Dec. 1957, p. 389-394.

Various applications of epoxy resins for coatings, adhesive and filler on light metals. Epoxy resin also used for tooling material.
(A general, K12, L26p, 17-57; NM-d)

111-A. French Aluminum Industry. Georges A. Baudart. *Metal Progress,* v. 73, Jan. 1958, p. 72-75.

The lead taken by France's pioneering scientists in Al technology has been maintained by their successors. Recent changes in cell design and operations have decreased power requirements by 27%, and man-hours by 66%.
(A4p, C23, F23; Al)

112-A. Progress of Metallurgy in Europe. Hubert Sutton. *Metal Progress,* v. 73, Jan. 1958, p. 102-104.

Metallurgical education in England is steadily expanding, although free and rapid interchange of information leaves something to be desired. Pressing problems in Europe as in America have to do with brittle behavior of metals, resistance to hot corrosive surroundings and damage by thermal or stress cycling.
(A9, A3)

113-A. Iron and Steel Needs of Argentina. Juan B. De Nardo. *Metal Progress,* v. 73, Jan. 1958, p. 109-111.

In the late 1920's Argentina produced only 10% of its needed iron and steel; now it makes 30%. Future deficits will be reduced when the San Nicolas steel mill starts production. Annual needs for 1,200,000 metric tons are predicted during the 1960 decade.
(A4p, D general; ST)

114-A. Heat Resistant Alloys. *Metalworking,* v. 8, Oct. 1957, p. 107-109.

Tabular data on heat resistant alloys giving typical composition and heat treating recommendations for a wide variety of stainless steels, Ni-base, Cr-base and Co-base alloys.
(A general, J general; SGA-h)

115-A. Putting Honeycomb Scrap to Work. Jack Lewis. *Tool Engineer,* v. 34, Dec. 1957, p. 91-92.

154-A. Metallurgical Engineering and Atomic Energy. R. Carson Dalzell. *Journal of Engineering Education,* v. 48, Dec. 1957, p. 188-192.

Role of metallurgy and ceramics in atomic energy; educational programs for engineers initiated by A.E.C. (A3, T11, W11p)

155-A.* U. S. Progress in Titanium During 1957. W. J. Harris, Jr. *Journal of Metals,* v. 10, Jan. 1958, p. 19-20.

Sponge capacity; continuous cold strip rolling; heat treating techniques; new alloys; temperature and weldability limitations; costs; future outlook. (A general; Ti)

156-A.* Titanium in Britain and the Continent. Eric Swainson. *Journal of Metals,* v. 10, Jan. 1958, p. 21-24.

Titanium sponge, ingot and fabricated forms are now produced commercially in France, Western Germany and Britain. In addition, pilot plants have been operated in Sweden, Italy and Austria, and commercial production may have started. Description of sodium reduction process developed in England by Imperial Chemical Industries Ltd. (A4p, C19; Ti)

157-A. Soviet Titanium Research and Production. John P. Nielsen. *Journal of Metals,* v. 10, Jan. 1958, p. 25-26.

Russian progress as observed in a visit to the USSR. (A4p, A9; Ti)

158-A. Aluminum and France. F. Weston Starratt. *Journal of Metals,* v. 10, Jan. 1958, p. 38-43.

Bauxite mines, alumina plants and Al reduction works of Pechiney, France's leader in Al.
(A4, A11a, C general; Al)

159-A. Thirty Years in American Metallurgy. John J. B. Rutherford. *Metal Progress,* v. 73, Feb. 1958, p. 106-111.

In retrospect, the state of metallurgical art, science and industry existing in 1926 (when Sauveur gave a "modern" definition of the microconstituents in steel) appears rather elementary in many fields—metallography, materials, manufacturing methods, control.
(A2, M general)

160-A. Alloys for Making Castings. J. L. Rice, R. W. Ruddle and P. A. Russell. *Machinery Market,* no. 2980, Dec. 28, 1957, p. 24-26.

Development of superalloys for service up to 800° C. and higher. These are of four general types: (1) primary ferrous alloys containing substantial amounts of Ni and Cr, (2) alloys whose major constituents are Cr, Ni and Co, (3) Ni-base alloys, (4) Co-base alloys. (A general, 5; SGA-h, Ni, Cr, Co)

161-A. Salaries of Metallurgists. Walter Morrison. *Metal Progress,* v. 73, Feb. 1958, p. 93-96.

A survey of all members classed as metallurgists or metallurgical engineers shows that, on the average, starting salaries measured in present-day purchasing power have steadily increased since the depression years, and as much as 45% since 1949. Their salaries are considerably higher than those of the 108,000 engineers surveyed in 1956 by Engineers Joint Council. (A6q)

162-A.* (French.) **Commercial Grades of Ferronickel and Their Principal Applications. Pt. 2.** Jean A. Ternisien. *Metallurgie et la Construction Mécanique,* v. 89, Nov. 1957, p. 917-925.

Composition and properties, mechanical, magnetic and electrical, and commercial designations of 46 American and European alloys; applications of many, particularly in electrical and electronic equipment. 31 ref.
(A general, T1, 17-57; Fe, Ni, SGA-n)

163-A. (German.) **Properties and Manufacture of WC-Co Alloys.** W. J. Tretjakow. *Die Technik,* v. 12, Nov. 1957, p. 733-735.

8 ref. (A-general, Q-general; W, Co, 6-70)

164-A. (German.) **Geochemical Aspects of Rare Metals; Importance in Modern Technology.** H. Reh and H. J. Rosler. *Die Technik,* v. 12, Nov. 1957, p. 741-745.

Resources of Rb, Cs, Be, Ce, Ti, Hf, Th, V, Re, Pt, Ga, In, Tl, Ge, Se and Te. (A11a; RM-n)

165-A. (German.) **Titanium and Titanium Alloys.** U. Zwicker. *Die Technik,* v. 12, Dec. 1957, p. 815-818.
(A-general; Ti)

166-A. (Hungarian.) **History of Hungarian Art-Founding.** Laszlo Jakoby. *Kohaszati Lapok (Ontöde),* v. 12, June 1957, p. 135-138.

293-A. How to Treat Pickle Liquors in a Small Plant. Edward W. Lang. *Metal Progress,* v. 73, May 1958, p. 93-96.

A crystallization-regeneration unit at Vulcan Rivet & Bolt Corp., Birmingham, Ala., has solved the problem of disposal of pickle liquors from a 1200-gal. batch tank. The system is based on removing 400-gal. portions of liquor, crystallizing ferrous sulphate for economical disposal and returning regenerated liquor to the tank. (A8b, L12g)

294-A. Better Ways to Fabricate High-Temperature Materials. *Metal Progress,* v. 73, May 1958, p. 97-101.

Aircraft and missile needs are setting the pace for development of improved high-temperature materials and better methods for fabricating them. Investment casting in vacuum opens up a promising area. Slip casting can be used to fabricate parts that cannot be made any other way. Better control of processing variables in wrought fabrication gives improved properties.
(A-general, Q-general, 2-62; SGA-h)

295-A.* Pearlitic Malleable Iron. James H. Lansing. *Metal Progress,* v. 73, May 1958, p. 102-103.

Rapid increase in use of pearlitic malleable castings in recent years presages many new areas of application for the future.

302-A. Alumina-Base Cermets. Pt. 4. J. W. Lindenthall, J. G. Stradley and T. S. Shevlin. Ohio State University Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131342, May 1957, 19 p. $.50.

Studies were made by pre-reacting alumina with easily reducible oxides such as those of Cr, Ni and Co. Compounded into cermet compositions, these mixed oxides promoted wetting or reaction with the metallic constituents. Specimens containing 50 vol. % of iron and 50 vol. % of oxide were developed. They were nearly nonporous, as strong as the metal alone, and their high elastic moduli indicated good bonding. (A-general; Al, Cr, Co, Fe, Ni, 6-70)

303-A. Foamed Metal Developed for Sandwich Construction Core. Pt. 1, 2, 3. J. Bjorksten, J. C. Elliott and R. J. Roth. Bjorksten Research Laboratories, Inc. (Wright Air Development Center.) *U. S. 355-A. (Russian.) **New Heat Resistant Magnetic Alloys Alfenol and Thermenol.** *Metallovedenie i Obrabotka Metallov,* no. 2, Feb. 1958, p. 50-51.

6 ref. (A-general, P16, Q-general; Al, Fe, SGA-h)

356-A. (Russian.) **Relation Between Iron and Steel Production.** L. L. Zusman. *Stal',* v. 18, Apr. 1958, p. 358-363.

Apportionment of raw materials and equipment in gearing iron and steel production to meet nation's industrial needs. (A-general, A4p; ST)

357-A. (Book.) **Man, Metals and Modern Magic.** J. Gordon Parr. 1958. 238 p. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $2.95.

Metallurgical experience and knowledge from its beginnings more than 6000 years ago to the present. Practices in shaping Au and Ag, smelting, working, alloying and casting Cu and bronze, reduction of iron ore and production of wrought iron, cast iron and steel. Production and fabrication of Al, alloy steel, Ti, Mg and superalloys. (A2)

358-A. (Book.) **Transactions of American Society for Metals.** Ray T. Bayless, Ed. 1139 p. v. 50. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $10.

Contains 56 papers which were abstracted separately as preprints in 1957. (A-general)

359-A. (Book.) **Automation in Practice.** S. E. Rusinoff. 261 p. 1957. American Technical Society, Chicago, Ill. $6.50.

Survey of automation techniques as applied to various manufacturing and metalworking processes. Implications of automation: principles of the feedback control loop, basic devices for effecting hydraulic pneumatic, electric and electronic functions. Application to metalworking, metal cutting, pressworking, joining, heat treating, casting, metal production and systems of automatic inspection and control.
(A-general, 18-74)

360-A. (Book.) **Cost Finding in the Nonferrous Metals Industry.** 1957. 158 p. The British Nonferrous Metals Federation, Birmingham, England.

General principles, metal cost and computation of metal losses, ex-

pense classifications and allocation, depreciation, estimating and forecasting, cost computation, financial accounts. (A4s, E-general; EG-a38)

361-A. (Book.) **Statistics of the Iron and Steel Industry of Japan for 1957.** 92 p. 1958. Japan Iron and Steel Federation, Tekko Bldg., 1, Marunouchi Chiyoda-Ku, Tokyo.

(A4p; ST)

362-A. (Book.) **Concise International Dictionary of Mechanics and Geology.** English, French, German and Spanish. S. A. Copper. 400 p. 1958. Philosophical Library Inc., 15 East 40th St., New York 16, N. Y. $6.

Includes many metallurgical terms; each language separately indexed. (A-general, 11-17)

363-A. (Book.) **Titanium, the Industry, Its Future, Its Equities.** 100 p. 1957. F. S. Smithers & Co., 1 Wall St., New York 5, N. Y.

Properties, raw material sources, ore processing, Ti production processes, production economics; companies producing Ti metal, Ti markets and equities. 35 ref. (A-general, Ti)

364-A. (Book—German.) **Gmelin's Handbook of Inorganic Chemistry. 8th Ed.. Calcium.** P. B2. Gmelin Institute. 392 p. 1957. Verlag Chemie, GmbH. Weinheim/Bergstr. Germany. $52.56.

Hydrides, oxides, hydroxides, peroxides and nitrogen compounds of calcium. (A-general, 11-68; Ca)

365-A. (Book—German.) **Gmelin's Handbook of Inorganic Chemistry. 8th Ed. System No. 60. Copper. Pt. Bl.** Gmelin Institute. 624 p. 1958. Verlag Chemie GmbH. Weinheim/Bergstr. Germany. $83.76.

Copper compounds with oxygen, nitrogen, the halogens, sulphur, selenium and tellurium. (A-general, 11-68; Cu)

366-A. (Book—German.) **Gmelin's Handbook of Inorganic Chemistry. 8th Ed. Systematic Subject Index.** Gmelin Institute. 58 p. 1957. Verlag Chemie GmbH. Weinheim/Bergstr. Germany. $17.28.

Gmelin classification system. (A-general, 11-68)

367-A. (Book—Spanish.) **Second National Congress of the Steel Industry,** Mar. 1957, Camara Nacional de la Industria Del Hierro y Del Acero, Av. Insurgentes 263, Mexico City 7, Mexico. 100 pesos.

Papers abstracted separately. (A-general; ST)

368-A. Gold. J. P. Ryan and Kathleen M. McBreen. *Bureau of Mines Minerals Yearbook,* Preprint, 1956, 21 p.

Mine production for 1956. (A4p; Au)

369-A. Iron Ore. Horace T. Reno. *Bureau of Mines Minerals Yearbook,* Preprint, 1956, 32 p.

Salient statistics of domestic iron ore activity, 1955-1956. (A4p, RM-n, Fe)

370-A. Secondary Metals—Nonferrous. Archie J. McDermid. *Bureau of Mines Minerals Yearbook,* Preprint, 1956, 30 p.

Production figures for secondary recovery of aluminum, antimony, copper and brass, lead, magnesium, nickel, tin and zinc. (A4p, A11d; Al, Sb, Pb, Cu, Mg, Ni, Sn, Zn)

371-A. Tin. Abbott Renick and John B. Umhau. *Bureau of Mines Minerals Yearbook,* Preprint, 1955, 16 p.

Domestic and foreign production, consumption and foreign trade. (A-general; Sn)

372-A. Uranium. John E. Crawford. *Bureau of Mines Minerals Yearbook,* Preprint, 1955, 30 p.

Domestic production, technology, consumption, uses and foreign trade. 37 ref. (A-general; U)

373-A. A Promising New Metal. Gary Wilcox. *Iowa Engineer,* Apr. 1958, p. 29-30.

Columbium offers excellent promise as a structural metal when temperatures exceed 1800° F. (A-general, 17-57; Cb)

374-A. Production of Ferro-Alloys. G. Volkert. *Iron and Coal Trades Review,* v. 176, Apr. 18, 1958, p. 909-913. (A-general, D8n, D8p; AD-n)

375-A. A Milestone in Ferrous Metallurgy. M. Schofield. *Iron and Steel,* v. 31, May 1958, p. 173-174.

Note on the role of Abraham Darby and other persons involved in a successful conversion from charcoal to coke for the reduction of iron ore in 18th Century England. (A2; RM-j43, Fe)

376-A. Uncommon Engineering Metals. J. P. Denny and L. F. Kendall. *Machine Design,* May 29, 1958, p. 150.

Properties and applications of zirconium, hafnium, vanadium, columbium, tantalum, chromium and rhenium. (A-general, Zr, Hf, V, Cb, Ta, Cr, Rh)

377-A. Research Laboratories. General Electric Co., Ltd., Wembley. N.

L. Harris. *Metal Industry,* v. 92, May 16, 1958; p. 407-408.
(A9h, N1c, J2k)

378-A. Manganese: Major Strategic Metal. *Mining and Engineering Journal,* v. 69, Pt. 1, Mar. 28, 1958, p. 515-521.
(A-general; Mn)

379-A. Low Grade Ores in North American Steel Production. *Mining Journal,* v. 250, Apr. 18, 1958, p. 441-442.
(A4p, A11a; RM-n)

380-A. Titanium Production Developments Including Metallurgy and Alloying. R. I. Jaffee. *North Atlantic Treaty Organization, Advisory Group for Aeronautical Research and Development,* Report 94, 1957, 90 p.
The past, present and future of the Ti industry discussed in terms of cost and quantities of the metal produced. Various methods for melting, casting and fabrication; techniques of descaling, finishing, joining and machining. 26 ref.
(A-general; Ti)

381-A. Is This Steel Really Stainless? F. P. A. Robinson. *South African Engineer,* v. 49, Apr. 1958, p. 17-23.
10 ref. (A-general; SS)

382-A. Bibliography of Nickel. Ethel M. Pratt and Henry R. Cornwall. *U. S. Geological Survey Bulletin 1019-k,* 1958, 60 p.
(A-general, 10-65; Ni)

383-A. Bethlehem Steel Improves Acid Pickling Wastes Treatment Plant. F. B. Milligan. *Wastes Engineering,* v. 29, May 1958, p. 258-260.
(A8b, L12g)

384-A. (English.) **Data on the History of Metallurgy in Hungary. Pt. 6.** A. Schleicher. *Acta Technica,* v. 20, no. 1-2, 1958, p. 137-142.
Sketches of blast furnace and blast engine dated 1816 giving dimensions and other data. 6 ref.
(A2, W17g, Fe)

385-A. (French.) **Aluminium-Lacq.** G. A. Baudart. *Revue de l'Aluminium,* v. 35, Apr. 1958, p. 390-395.
One entirely new plant and additional facilities to be installed in an existing plant will increase French aluminum production by 50%.
(A4p; Al))

386-A. (Portuguese.) **Ferrotitanium.** Manuel Chagas Roquete. *Tecnica,* v. 32, Feb. 1958, p. 321-323.
13 ref. (A-general; AD-n, Fe, Ti)

387-A. Raw Material Supplies and the Future Development of the Iron and Steel Industry. C. R. Wheeler. *Iron and Steel Institute, Journal,* v. 189, June 1958, p. 101-109.
Presidential address to the British Iron and Steel Institute.
(A4, A11, D-general; ST)

388-A.* Rare Earths in Industry. K. Vlasov and B. Kogan. *Journal of Scientific and Industrial Research,* v. 17A, Feb. 1958, p. 41-42.
Rare-earth metals in steel, light metals and nuclear reactor applications.
(A-general, W11p, 17-57; EG-g)

389-A. Production Problems of Titanium and Its Alloys. E. Swainson and R. L. P. Berry. *North Atlantic Treaty Organization, Advisory Group for Aeronautical Research and Development,* Report 95, 1957, 29 p.
Effect of impurities, allotropic transformations, alloying, heat treatment; reduction of Ti; melting techniques; scrap reclamation; primary fabrication including hot working, extrusion and welding. (A-general, C-general, F-general; Ti-b)

390-A. Uranium. John E. Crawford and James Paone. *U. S. Bureau of Mines Minerals Yearbook,* Preprint, 1956, 46 p.
Production statistics, prices and technology during 1956. (A4p, U)

391-A. Titanium. Jesse A. Miller. *U. S. Bureau of Mines Minerals Yearbook,* Preprint, 1956, 25 p.
Production and consumption statistics for 1958. (A4p, Ti)

392-A. (French.) **Nitriding of Iron Was Utilized by the Ancients.** Jean R. Marechal. *Métaux Corrosion-Industries,* no. 391, Mar. 1958, p. 133-137.
(A2, J28k; CI)

393-A.* High-Boron Alloy Steels. T. H. Middleham, J. R. Rait and E. W. Colbeck. *British Nuclear Energy Conference, Journal,* v. 3, Apr. 1958, p. 116-135.
New technique for the production of steels containing up to about 4.75% B which can be forged, rolled and extruded, and alloys up to about 6% B which can be cast. Methods of manufacture, physical and mechanical properties, and constitution of these steels; applications in thermal nuclear reactors. 23 ref.
(A-general, T11, 17-57; AY, *B*)

394-A. Survey of Developments in the Titanium Industry During 1956. T. H. Janes. *Canadian Department*

of Mines and Technical Surveys, M.R. 26, Aug. 1957, 40 p.
9 ref. (A-general; Ti)

395-A. Story of Stainless Steel. *Chicago Purchasor,* v. 36, Jan. 1958, p. 108.
Mechanical, physical and corrosion resistance properties of the three classifications of stainless steels: chromium-hardenable (400 series); chromium-nonhardenable; chromium-nickel (300 series).
(A-general; SS)

396-A. The Structure of Steel. Pt. 5. Alloy Steels. Edwin Gregory and Eric N. Simons. *Edgar Allen News,* v. 37, May 1958, p. 101-103.
Role of chromium, vanadium, molybdenum, tungsten and cobalt in steel. (To be continued.) (A-general, 2-60; AY, *Cr, V, Mo, W, Co*)

397-A. Raw Materials and the Future Development of the Iron and Steel Industry. C. R. Wheller. *Iron and Coal Trades Review,* v. 176, May 23, 1958, p. 1213-1218.
(A11a; ST)

398-A. Low-Copper Brasses. Aleksander Krupkowski and Czeslaw Adamski. *Polish Academy of Sciences, Review,* v. 2, July-Dec. 1957, p. 64-70.
Composition and properties of some Polish alloys.
(A-general, Cu-n)

399-A.* The Metallurgy of Beryllium. I. E. Nenham. *Research Applied in Industry,* v. 11, May 1958, p. 185-191.
Problems in developing Be are centered around mineral concentration, chemical extraction and purification, and metal reduction and fabrication. The danger of Be-induced health hazards is also a serious deterrent to the economical exploitation of the metal and its compounds. 25 ref.

431-A. Iron and Steel. James C. O. Harris. *U. S. Bureau of Mines Minerals Yearbook,* Preprint, 1956, 27 p.
Production statistics and prices for 1956. 29 ref. (A4p, A4s; Fe, ST)

432-A. Magnesium. H. B. Camstock. *U. S. Bureau of Mines Minerals Yearbook,* Preprint, 1956, 10 p.
Production statistics and prices for 1956. 31 ref. (A4p, A4s; Mg)

433-A. Platinum-Group Metals. J. P. Ryan and Kathleen M. McBreen. *U. S. Bureau of Mines Minerals Yearbook,* Preprint, 1956, 16 p.

Production statistics and prices for 1956. 12 ref. (A4p, A4s; EG-c)

434-A. Vanadium. Phillip M. Busch and Kathleen McNulty. *U. S. Bureau of Mines Mineral Yearbook,* Preprint, 1956, 10 p.

Production statistics and prices for 1956. (A4p, A4s; V)

435-A. (German.) **Austria's Contribution to the Development of Metallurgy of Iron.** H. Malzacher. *Oesterreichische Ingenieur Zeitschrift,* no. 4, Apr. 1958, p. 173-175.

(A-general; Fe)

436-A. (Russian.) **Production of Nonaging Boron Steel and Its Properties.** Kh. Levinzon and A. D. Litvinenko. *Stal',* v. 18, Mar. 1958, p. 249-252.

A review of recent literature. 9 ref. (A-general; AY, *B*)

437-A. (Pamphlet.) **A Perspective of Molybdenum-Base Alloys.** Alvin J. Herzig. *American Society for Testing Materials,* 1957, 33 p.

Sixth Gillett Memorial Lecture. Properties, applications, effect of alloying additions and fabrication. (A-general; Mo)

438-A. (Book.) **Kaiser Aluminum Sheet and Plate Product Information.** 2nd Ed. 1958. 308 p. Kaiser Aluminum & Chemical Sales, Inc., 919 N. Michigan Ave., Chicago 11, Ill. $5.

Manufacture, availability, physical and chemical attributes; basic facts helpful in the proper selection and use of Al sheet and plate alloys; fabrication and finishing methods. (A-general; Al, 4-53)

439-A. (Book.) **Metal Industry Handbook and Directory.** 544 p. 1958. Iliffe and Sons Ltd., Dorset House, Stamford St., S.E.1, London, England. (Free.)

General properties of metals and alloys; data and tables; electroplating and allied processes; directories of trade names, metal and allied trades associations and scientific and technical institutions. (A-general; 11-67)

440-A. (Book.) **Metal Statistics.** 51st Ed., 1958. 400 p. American Metal Market, 18 Cliff St., New York 38, N. Y. $3.50.

Covers important metals from Al and Be to V and Zn. Approximately one-third of the data deals with iron and steel. Among the new data tables added this year are bauxite production, chromite production and shipments of Al foil. (A4)

441-A. (Book.) **Safety in Welding and Cutting. American Standard Z49.1-1958.** 49 p. 1958. American Welding Society, 33 W. 39th St., New York 18, N. Y. $2.

(A7, K1, K3, G22h)

442-A. (Book.) **Wire Industry Encyclopaedic Handbook,** 484 p. 1958. Wire Industry, Ltd., 33 Furnival St., London, E.C.4, England. (Free.)

Glossary, tables; directories of manufacturers and associations. (A-general, 4-61, 11-67)

443-A. (Book.) **Yearbook of the American Bureau of Metal Statistics.** 136 p. June 1958. American Bureau of Metal Statistics, 50 Broadway, New York, N. Y. $4.50.

Statistical information concerning mine production, smelter production, consumption, imports and exports and other economic statistics on a world-wide basis. (A4p)

444-A. (Book—German.) **Metals in Mechanical Engineering.** 2nd Ed. E. Bickel. 439 p. 1958. Lange & Springer, Reichpietschufer 20, Berlin W 35, Germany. DM. 37.50.

Selection of metals for various applications; structure of metals; properties and testing. (A-general, 17-57)

445-A. Health and Safety in Foundries. George Barnett. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 17-30.

Foundry hazards caused by dust and fumes. Other types of injuries and preventive measures. 51 ref. (A7p, E-general)

446-A.* New Commutator Alloy Takes the Heat. Webster Hodge. *Iron Age,* v. 182, July 10, 1958, p. 102-103.

Designed especially for use in small electric motors and alternators, this special Zr-Cu alloy can retain its strength at high temperatures. (A-general; Q-general, T1, 17-57; Zr, Cu)

447-A. The Future of Titanium. Tom Margerison. *New Scientist,* v. 4, June 12, 1958, p. 156-158.

Prospects are excellent due to excellent corrosion resistance and an eventual reduction in costs which will result from increased volume of production. (A-general; Ti)

448-A. New Developments in Steelmaking in Europe. D. L. McBride. *Society of Automotive Engineers, Preprint* 30C, Mar. 1958, 9 p.

13 ref. (A-general, D-general; ST)

454-A.* Low-Cost Cryogenic Steel Goes Commercial. J. Procter. *Chemical Engineering,* v. 65, July 14, 1958, p. 160-164.

New 9% Ni alloy has high tensile and yield strength at low temperatures (to −350° F.).
(A-general; SS, Ni, 2-63)

455-A.* Gray Iron Has Unique Wear-Resistant Properties. Joseph R. Diear. *Foundry,* v. 86, Aug. 1958, p. 62-63.

Amount and structure of graphite on iron has a strong influence on boundary lubrication properties. Proper graphite structure prevents galling and welding during time of metal-to-metal contact.
(A-general; CI-n)

456-A.* Modifications to the Fontana Open Hearth Precipitators. Earl V. Akerlow. *Iron and Steel Engineer,* v. 35, July 1958, p. 97-103.

Dry electrostatic precipitators at Kaiser Steel Corp., Oakland, Calif., employ saturable reactor control with selenium rectifier transformers as well as conventional mechanical rectifier equipment, special collecting and discharging electrodes, specially designed rapping equipment and gas distribution apparatus.
(A8a, W13c)

457-A.* Safeguarding Steel Production. R. M. L. Russell. *Iron and Steel Engineer,* v. 35, July 1958, p. 112-123.

"Hot spots" in steel mills; prevention, control and extinguishing of fires; carbon dioxide systems, automatic sprinkler systems. (A7)

458-A.* The Growing Canadian Steel Industry. D. S. Holbrook. *Iron and Steel Engineer,* v. 35, July 1958, p. 133-136.

Canadian government's tax policy on depreciation stimulates expansion and efficient practice.
(A-general; ST)

459-A.* Strength Skyrockets in Formable Titanium. *Machine Design,* v. 30, July 10, 1958, p. 12, 14.

Three new solution treated anneal Ti alloys have extremely high strength-weight ratio, excellent corrosion resistance.
(A-general; Ti, Al, Mo, V)

460-A.* (German.) **Recent Developments in Whiteheart, Blackheart and Pearlitic Malleable Cast Iron.** A. Hohmann. *Giesserei-Praxis,* v. 76, Apr. 10, 1958, p. 117-119.

German standards GTW 35, GTW 40, GTS 35 and GTS 40, as well as U. S. standard and pearlitic malleable cast irons discussed; processing; properties. Tempering in Cr-Ni steel container advised, proper ratio of pig and scrap in percent. Emphasizes improved properties through induction hardening, gives scheme of suitable equipment with data of current and temperatures. New aspects in production through growing use pointed out.
(A-general, S22; CI-s)

461-A.* (German.) **"Erftal", a High Gloss Mill Aluminum.** H. Ginsberg, R. Lattey and H. Neunzig. *Metall,* v. 12, June 1958, p. 497-501.

Aluminum (99.9% Al, < 0.04% Fe), can be brought to a high gloss finish thrcugh repeated annealing. Through the annealing the remaining impurities are kept in solution and are equally distributed. An addition of chromium acid to the finishing bath increased the reflecting properties. This process is particularly advantageous for consumer goods. Tables of composition, micrographs and reflection properties in relation to heat treatment.
(A-general, J23a; Al-a)

462-A. How to Set Production Standards for Pouring, Shifting and Shake-

out. J. E. Keith. *Foundry*, v. 86, July 1958, p. 85-89.

(A5d, E-general)

463-A.* Investment Casting Directory. Section 1. Technical Section. *Precision Metal Molding*, v. 16, June 1958, p. 58-61.

Data on composition of ferrous and nonferrous alloys commonly investment cast; mechanical properties of alloys in the as-cast and hardened conditions; includes aluminum, copper, nickel, cobalt, and magnesium-base alloys, carbon, low alloy, stainless and special steels. (A-general, E15)

464-A. Progress in Research in Iron and Steel Usage. *Sheet Metal Industries*, v. 35, July 1958, p. 543-547, 551.

Survey of the Annual Report of the British Iron and Steel Research Association for 1957. Topics covered include cold rolling, sheet and strip processing, tinplate manufacture, plastic-coated steel, structural engineering steels, corrosion and high-temperature steels. (A-general; ST)

465-A.* Iron-Aluminum Base Alloys. Cheap Stainlesses of the Future. Blake King, J. J. Mueller, N. N. Ida and F. G. Tate. *Society of Automotive Engineers, Preprint 60B*, 1958, 20 p.

Experimental alloys prepared by the Martin Co., compare favorably in strength and ductility at both high and low temperatures with the ferritic stainless steels. 9 ref. (A-general; Al, Fe)

466-A. Hypereutectic Aluminum-Silicon Alloys. Richard M. Smith. *Society for Automotive Engineers, Preprint 65A*, 1958, 8 p.

Evaluation of foundry characteristics, physical and mechanical properties, corrosion resistance. (A-general; Al, Si)

467-A.* Workhorses of the Industry: PH Stainless Steels. J. N. Barnett and W. W. Rohde. *Aviation Age, Research and Development Technical Handbook*, 1958-59, p. 6-9.

Composition and properties of 17-7 PH, 17-4 PH and 15-7 PH stainless steels. (A-general; SS)

468-A.* Metal Strengths at High Temperatures. *Aviation Age, Research and Development Technical Handbook*, 1958-59, p. 10-11.

Table giving Himatic tensile strength, yield strength, elongation and modulus of elasticity for several Al, Mg, Ti, Ni and Co alloys from room temperature to 1000° F. (A-general, 2-62)

469-A.* "Exotic" Metals. *Aviation Age, Research and Development Technical Handbook*, 1958-59, p. 10-11.

Table giving mechanical properties of Be, Ti, Mo, Ta, V, 25TiV, W from room temperature to 4000° F. (A-general, 2-62)

470-A.* Average Properties of Structural Carbon and Graphite. *Aviation Age, Research and Development Technical Handbook*, 1958-59, p. 12.

Table showing commercial designation, available sizes and properties. (A-general; RM-h39)

471-A.* New Hardenable Titanium. Robert W. Carson. *Product Engineering*, v. 29, July 21, 1958, p. 68-69.

Age-hardening alloy combines high strength (up to 240,000 psi.), corrosion resistance of pure Ti, service temperatures of 600 to 800° F. and the highest strength-weight ratios available. (A-general; Ti)

472-A.* New Super Alloy Bids for Hot Jobs. F. Kenneth Iverson and M. A. Pohlman. *Product Engineering*, v. 29, July 21, 1958, p. 76-77.

New high-temperature Ni superalloy, Rene 41, has improved stress-rupture strength, good ductility and formability, low distortion, good weldability, corrosion resistance. (A-general, Q-general; Ni, SGA-h)

473-A. (Russian.) **How to Make Effective Use of Metal Shavings.** I. N. Goncharov, I. A. Azarov and Yu. G. Dorofeev. *Vestnik Machinostroeniya*, v. 38, June 1958, p. 46-49.

Shavings are pressed into briquettes in a specially built furnace under hammer pressure. Machine parts made from these briquettes were three times stronger than those made from original steel. (A11d; ST)

474-A. Pulsometer-Tett Water-Treatment Processes. *Corrosion Technology*, v. 5, July 1958, p. 225-226.

Chemical reagents are added to correct overhardness, softness, acidity or alkalinity and to form a flocculent precipitation on the surface of the filtering medium to trap over 95% of the bacteria and other matter in suspension minute enough to pass through the filtering medium. (A8b, NMa-38)

Present and future production capacity; available stocks; consumption in North America and the free world. (A4, A11a; Ni)

515-A. (Book.) **Engineering Materials.** 607 p. 1958. Pittman Publishing Corp., 2 W. 45th St., New York 3, N. Y. $8.50.

Background information on construction and other engineering materials, their production and principal properties. One-third of text is devoted to metals, covering structure and constitution of metals and alloys, manufacture, shaping, properties, uses, etc., of cast iron, steel, wrought iron, malleable cast iron, nonferrous metals and alloys, corrosion and anti-corrosion protection, testing of materials. (A-general)

516-A.* **New Engineering Metals.** J. P. Denny and L. F. Kendall. *Mechanical Engineering,* v. 80, Aug. 1958, p. 67-71.

Availability, properties, prices of zirconium, hafnium, vanadium, columbium, tantalum, chromium and rhenium. (A-general; Cr, Cb, Hf, Ta, V, Zr, Rh)

517-A. Development of ZM41 Magnesium Sheet Alloy. H. A. Johnson and R. D. Masteller. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131417, Sept. 1957, 29 p. $.75.

Magnesium alloy system was superior to AZ31 sheet alloy. Designated ZM41, the new alloy has a nominal composition of 4% Zn, 1.0% Mn, 0.7% mischmetal, balance Mg. ZM41 showed consistently better tensile properties than AZ31B, together with more uniform properties in the transverse and longitudinal directions. ZM41-mischmetal alloys displayed an increased resistance to corrosion compared to AZ31B. The new alloy can tolerate a greater amount of iron than AZ31B without seriously decreasing corrosion resistance. Mischmetal was found to increase the hot rollability of Mg-Zn alloys. (A-general; Mg, Zn)

518-A.* **Why Should I Use Titanium?** Paul M. Tyler. *Metal Progress,* v. 74, Aug. 1958, p. 110-114.

The inherent advantages of Ti and improvements achieved by alloying. Contrasted with these are some disadvantages largely reflected in difficulties in fabrication. The Sheet Rolling Program is one organized attack to solve some of the latter problems. (A-general, 17-57; Ti)

519-A.* (French.) **Manufacture and Properties of Spheroidal Graphite Cast Iron.** M. Eudier and L. Hallot. *Metaux-Corrosion-Industries,* v. 33, May 1958, p. 212-227.

Composition of starting material and effects of various elements on structure and properties of SG iron; use of basic and acid cupolas; Mg alloys used in treating molten metal; methods of introducing Mg into bath and into ladle; mechanical properties of specimens and parts in SG iron; heat treatment of SG irons. (A-general; CI-r)

520-A.* **Centrifugal Castings. Pt. 1. Ferrous Metals.** John L. Everhart. *Materials in Design Engineering,* v. 48, Aug. 1958, p. 89-93.

Advantages and disadvantages of centrifugal castings of carbon steels, alloy steels, stainless steels and gray iron. Applications and typical properties tabulated. 8 ref.
(A-general; 5-65, CN, AY, SS, CI)

521-A. Magnesium Alloys With High Melting Point Additions. R. R. Nash. Rensselaer Polytechnic Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131198, Mar. 1957, 196 p. $5.

Determination of alloying characteristics, influence on microstructures, mechanical properties and corrosion resistance of additions of high melting point elements to Mg and Mg-base alloys.
(A-general; Mg-b, AD-q)

522-A. How Can We Hurdle the "Materials Roadblock"? Irwin Stam-

bler. *Aviation Age,* v. 30, Aug. 1958, p. 18-19, 93-97.

Research trends in high-temperature alloys. (A-general;SGA-h, 17-57)

523-A. Evaluation of the Blaw-Knox—Ruthner Pilot Plant. J. H. Strassburger. *Blast Furnace and Steel Plant,* v. 46, June 1958, p. 587-594.

Process compares favorably with existing processes for recovery of usable H_2SO_4, HCl and FeO. (A8b, A9j)

524-A. Notes on the Geochemistry and Economic Concentration of Vanadium. D. R. Williamson. *Colorado School of Mines Mineral Industries Bulletin,* v. 1, July 1958, 16 p.

36 ref. (A11a, B-general; V)

525-A. New PERA Workshops. *Iron and Steel,* v. 31, July 1958, p. 365-368.

Research facilities and metal cutting and forming research at Melton Mowbray of Production Engineering Research Association of Great Britain. (A9h, G-general)

526-A. Wrought and Cast Magnesium-Thorium and Magnesium-Zirconium Alloys. *Materials in Design Engineering,* v. 48, July 1958, p. 121, 123.

Fabricating properties and corrosion resistance of wrought and cast Mg-Th and Mg-Zr alloys. Alloys include HM31X, HM21A-T8, HK31A, ZK60A-F, EZ33A, HZ32A, ZH62A and ZK51A. (A-general, P-general, Q-general, R-general; Mg, *Th, Zr)*

527-A. Growth of the Titanium Industry. Paul M. Tyler. *Metal Progress,* v. 74, July 1958, p. 97-100, 170, 172, 174, 176.

At a cost of six years' time, $250,000,000 of the Government's money plus nearly $100,000,000 of private capital, a complete Ti industry has been established in America. (A11a; Ti)

528-A. Forecast of an Information Center. Majorie R. Hyslop. *Metal Progress,* v. 74, July 1958, p. 108-111.

The A.S.M.'s research project at Western Reserve University has progressed far enough to prove that penetrating searches of technical and scientific literature can be made electronically. The first commercial service will very likely be to send to individual subscribers information about documents appearing currently in any chosen portion of the metallurgical field. (A14e)

529-A. The Titanium Situation. Herbert H. Kellogg. Digest of "Present Status and Future of the Titanium Industry in the U. S." *Metal Progress,* v. 74, July 1958, p. 185-186. (From *Schweizer Archiv für Angewandte Wissenschaft und Technik,* Jan. 1958.)

Future Ti cost and production estimates. (A4; Ti)

530-A. Vacuum Melted Alloys. *Metal Progress,* v. 74, Aug. 1958, p. 96B-96D.

Data sheet indicating grade, composition, source and applications of vacuum-melted alloys from 17 manufacturers. (A-general, C5k, 1-73)

531-A. IRSID Opens Pilot-Plant Laboratories. *Metal Progress,* v. 74, Aug. 1958, p. 123-124.

New research station of the French Iron and Steel Research Institute (IRSID) equipped primarily to study iron ore and hot metal techniques, will operate on tonnage sufficient to extrapolate full-scale methods. (A9j, B-general, D-general; Fe, ST)

532-A. A Simulation of Melting Shop Operations by Means of a Computer. R. Neate and W. J. Dacey. *Process Control and Automation,* v. 5, July 1958, p. 264-271.

(A9n, X14; ST)

533-A. Planning and Operating an Industrial Waste Disposal Plant. G. J. O'Kane. *Products Finishing,* v. 22, Aug. 1958, p. 38-45.

Waste disposal plant installed as part of the plating operations produces an almost colorless, clear effluent, free of detectable cyanides, cyanates, chromic acid or copper. (A8b, L17)

534-A. The Challenge of High Temperatures. F. D. Richardson. *Times Science Review (London),* no. 28, Summer 1958, p. 2.

High-temperature equipment and materials; refractories, future development. (A-general, 2-62; SGA-h)

535-A. Metallochemical Table of the Elements. I. I. Kornilov. *Academy of Sciences of the USSR, Proceedings,* v. 114, 1957, p. 449-452. (Translation by Consultants Bureau, Inc.)

Characteristics of the chemical reactions of metals with elements of the periodic system. Families of metals are shown capable of forming continuous solid solutions, limited solid solutions with metallic compounds, metallic compounds without solid solutions, compounds of an ionic type. 6 ref. (A-general, P10)

536-A. (French.) **Properties and Applications of Spheroidal Graphite Alloy Cast Irons.** J. Grilliat. *Metaux-Corrosion-Industries,* v. 33, May 1958, p. 228-242.

16 ref.
(A-general, Q-general, 17-57; CI-r)

537-A. (French.) **Canadian Aluminum Industry.** Michel C. Hugueney. *Revue de l'Aluminium,* v. 35, May 1958, p. 511-514.

Origins and growth of industry during and since World War II.
(A2, A4; Al)

538-A. (German.) **Measurement of Gas Traces in the Ironworks.** Fritz Bangert. *Stahl und Eisen,* v. 78, May 29, 1958, p. 743-747.

Measurement of gas traces by means of a portable gas detection apparatus. Dust measurements with a diaphragm filter. Continuous and automatic measurement of carbon monoxide in combination with warning devices. (A8a, X7h, E-general)

539-A. (Portuguese.) **Brazilian Steel Industry Perspectives.** Joao G. Haenl. *Engenharia, Mineracao e Metalurgia,* v. 27, May 1958, p. 259-262.

(A-general; ST)

540-A.* **PH Stainless Steels Beat the Heat.** J. N. Barnett and W. W. Rohde. *Aeronautical Procurement,* Aug. 1958, p. 21, 41.

Properties, applications of PH 15-7 Mo, 17-7 PH, 17-4 PH steels.
(A-general, Q-general, 17-57; SS, SGA-h)

541-A.* **Iron and Phosphate Slag From Byproduct Ferrophosphorus.** J. M. Potts, W. C. Scott, Jr., J. U. Campbell and J. A. Wilbanks. *Electrochemical Society, Journal,* v. 105, Mar. 1958, p. 148-151.

Process and furnace for converting byproduct ferrophosphorus into high-grade iron for metallurgical purposes and phosphatic slag that might be used as a fertilizer or animal-feed supplement. The process involves smelting ferrophosphorus, siliceous iron ore and burnt lime in an electric furnace. Refractory problem was solved through the use of a two-component furnace. 6 ref.
(A11d, W17; Fe, RM-q)

542-A.* (Spanish.) **Steel Industry in the United States.** Enrique O. Monge. *Universidad Nacional de Ingenieria, Boletin,* v. 30, July-Sept. 1957, p. 3-34.

Survey of raw material consumption, processing, melting, rolling and other steel mill operations. Furnaces and rolling equipment and types of products turned out.
(A-general, D-general, F23; ST)

543-A. **Cobalt in High-Temperature Alloys, Special Report No. 1.** F. R. Morral. *Battelle Memorial Institute,* 1958, 12 p.

Cobalt production, consumption and availability; properties of Co and Co alloys.
(A-general; Co, SGA-h)

544-A. **Aspects of Russian Engineering Industry.** *Machinery (London),* v. 93, Aug. 6, 1958, p. 286-300.

Russian machine tool facility at Sverdlov. (A-general, W25)

545-A. **Development of Metal Ceramics.** *Platinum Metals Review,* v. 2, Apr. 1958, p. 53-54.

(A-general; Pt, SGA-h, 6-70)

546-A. **Composition of Beryllium Borides.** L. Ya. Markovskii. *Doklady Akademii Nauk SSSR,* v. 101, no. 1, 1955, p. 97-98. (Henry Brutcher, Altadena, Calif., Translation no. 4091.)

(A-general; Be, B)

547-A. **The Metallurgy of Boron Structural Steels.** O. N. Meshcherinov. *Stal',* v. 18, no. 1, 1958, p. 75-81. (Henry Brutcher, Altadena, Calif., Translation no. 4256.)

Previously abstracted from original. See item 323-A, 1958.
(A-general; AY, B)

548-A. (French.) **New Ultra-Light Magnesium-Base Alloys.** *Genie Civil,* v. 135, June 1, 1958, p. 249-253.

(A-general; Mg-b)

549-A. (German.) **New Techniques for Selecting Employees in a Modern Cold Rolling Mill.** Werner Fuchs. *Stahl und Eisen,* v. 78, July 10, 1958, p. 974-977.

(A5, F23, 1-67; ST)

550-A. (Hungarian.) **Properties and Applications of Aluminum-Bronze Castings.** Gyula Emod. *Kohaszati Lapok-Ontode,* v. 91, Apr. 1958, p. 90-95.

6 ref. (A-general, Q-general, 17-57; *Al*, Cu-s, 5-60)

551-A. (Russian.) **Comparison of Metallurgical Progress Between U.S.A. and U.S.S.R.** V. A. Podzerko. *Metallurg*, v. 3, July 1958, p. 1-5.

(A-general)

552-A.* **Regeneration of Waste Pickle Liquor to Produce Ferrous Sulfate Monohydrate.** J. S. Atwood, J. S. Joseph and W. W. Hodge. *Engineering Bulletin, Twelfth Industrial Waste Conference, Proceedings*, no. 94, May 1957, p. 378-389.

Monohydrate process is cheapest method for handling over 10,000 gal. per day of waste acid. 7 ref. (A8b, L12g, NM-a31)

553-A. Iron - Chromium - Aluminum Alloys. J. E. Srawley. Naval Research Laboratory. *U. S. Office of Technical Services*, PB 131676, Apr. 1958, 19 p. $.50.

Alloys containing up to 25% Cr and 11% Al were produced by vacuum melting and hot worked by forging. When compared with Type 310 stainless steel, they were brittle at room and moderately high temperatures and weak above about 1200° F. Nevertheless, the alloys' oxidation resistance over-rode these disadvantages in some high-temperature applications, and tests showed that they are resistant to attack by combustion products of residual fuel oils. (A-general, Q-general, 2-62, R1h; Al, Cr, Fe, 4-51)

554-A.* (French.) **New Properties and Applications of Metals of Very High Purity.** G. Chaudron. *Revue de Metallurgie*, v. 55, May 1958, p. 407-416.

Purification of many common metals to the order of parts per million brings about many new physical properties. Results with Al and Fe include the appearance of polygonization and the competition between this phenomenon and recrystallization; high conductivity at low temperature; resistance to chemical attack and virtually complete suppression of certain diffusion phenonema. 21 ref.
(A-general, P-general, N-general, 3-69; Al-a, Fe-a)

555-A. (Rumanian.) **Thermo-Insulating Refractory Articles Made From Metallurgical Slag.** Al. Braniski, V. Siniansky and C. Cleper. *Studii si Cercetari Metalurgie*, no. 2, 1956, p. 369-377.

Laboratory investigations to determine possibility of utilizing porous, blast furnace slags in the manufacture of refractory thermo-insulating materials.
(A11d, D1, 17-57; RM-q)

556-A. (Chinese.) **A New Form of Commercial Material—Cast Iron With Spheroidal Graphite.** Chan I-Kwei. *Uli Tunbao*, no. 1, 1956, p. 9-15.

Survey of spheroidal-graphite cast iron, its production, properties and use. Tables list mechanical and physical properties and results of trials to determine tensile strength at high and low temperatures.
(A-general, CI-r)

557-A. Kaiser Steel Appropriates $214,000,000 to Expand Its Services to the Growing West. Charles Longenecker. *Blast Furnace and Steel Plant*, v. 46, Aug. 1958, p. 814-863.

Plant layout and equipment at Kaiser's Fontana, Calif., plant.
(A-general, W-general, 18-67; ST)

558-A. Kazakhstan—New Land of Soviet Metallurgy in Asia. R. Sewell. *British Steelmaker*, v. 24, July 1958, p. 212-213.

Steel production and resources of iron and other ores in Kazakhstan.
(A4p, A11a; Fe, ST, RM-n)

559-A. (French.) **Where Will the Belgian Steel Industry Obtain Iron Ore in the Future?** *Echo des Mines et de la Metallurgie*, no. 3516, May 1958, p. 287-288.

(A11a; Fe, RM-n)

566-A. (French.) **Current Trends in the Steel Industry.** Rene Damien. *Industrie Nationale,* Apr-June 1958, p. 19-40.

(A4; ST)

567-A. (Hungarian.) **Notes About Aluminum-Titanium-Vanadium Alloys.** K. R. Vassel. *Kohaszati Lapok,* v. 11, no. 11-12, 1956, p. 522-528.

Properties of the alloys of Ti with V and Al. 10 ref.
(A-general, Q-general; Al, Ti, V)

568-A. (Russian.) **Titanium, Its Alloys and Field of Application.** N. T. Gudtsov and L. D. Mashyakova. *Vestnik Akademii Nauk SSSR,* no. 2, 1957, p. 59-68.

History of ores, production of the metal, mechanical and engineering properties, heat treatment of Ti alloys and their use in various branches of industry.
(A-general; Ti)

569-A. (Book.) **Radiation Effects on Materials. Vol. 2.** 140 p. 1958. American Society for Testing Materials, Special Technical Publication. STP 220, 1916 Race St., Philadelphia 3, Pa. $3.75.

(A-general; S19; 2-67)

570-A. (Book.) **German-English, English German Iron and Steel Dictionary.** 272 p. 1958. Verlag Stahleisen m.b.H., Breite Strasse 27, Dusseldorf, Germany. 12.50 Marks.

Contains more than 7000 words in metallurgical, mechanical and electrical practice.
(A-general; 11-67)

571-A. (Book—Dutch, French, English, Spanish.) **Metal Products From Holland.** 340 p. 1958. Association of Metal Working Industries. Nassaulaan 13, The Hague, Netherlands.

Guide to Dutch metal products includes list of manufacturers, classified and alphabetical indexes.
(A-general, 11-67)

572-A.* (German.) **Dressing Dolomite During Thermal Production of Magnesium.** Ladislaus Jakoby. *Freiberger Forschungshefte,* no. B28, June 15, 1957, p. 42-49.

Study of dolomite in Hungary, its geology, possibility of its recovery and choice of fuel for silico-thermal reduction; availability of Hungary's energy resources.
(A-general; Mg, RM-n)

573-A.* (Italian.) **Germanium.** Giovanni Porro. *Industria Mineraria,* v. 9, Apr. 1958, p. 199-213.

Geology and mineralogy of Tsumeb deposits in Southwest Africa; extraction cycles employed in U. S., Belgium, Italy and Katanga; atomic structure and behavior of Ge; techniques of preparation of semiconductor Ge monocrystals; applications. 18 ref. (A-general; Ge)

574-A.* Metallurgy in Nuclear Engineering. Survey of the Literature in 1957. Pt. 2. J. Burkett. *Metallurgia,* v. 58, Aug. 1958, p. 64-66.

Metallurgy of reactor fuels—thorium, uranium, uranium dioxide, plutonium; welding of materials for nuclear reactors. 68 ref.
(A-general, T11, 17-57; U, Th, Pu)

575-A.* New Magnesium Alloys. R. J. M. Payne and N. Bailey. *Metallurgia,* v. 58, Aug. 1958, p. 67-68.

Series of Mg alloys useful in both cast and wrought conditions. Known as the M.S.R. alloys, they contain Ag, rare earth metals and Zr, and have higher proof stress figures than existing Mg alloys.
(A-general, Q27; Mg-b)

576-A.* (Polish.) **Analysis of the World Trend of Expansion of Rolling Mills for Production of Welded Tubes.** Wladyslaw Dobrucki. *Hutnik,* v. 25, Apr-May 1958, p. 156-164.

World production of tubes and present trend of capital investment in the industry. Improvements of tube rolling mills; economical factors and policies influencing fast growth of the mills. 32 ref.
(A4p, W23h; ST)

577-A. Working With Beryllium. *Light Metal Age,* v. 16, Aug. 1958, p. 6-9.

(A7q; Be)

578-A. New Air-Hardenable Steel Has 280,000 Psi. Tensile Strength. *Machine Design,* v. 30, Sept. 18, 1958, p. 38-39.

Airsteel X-200 developed by U. S. Steel. (A-general, Q27a; ST)

579-A. Plant Layout Case Studies. *Metalworking Production,* v. 102, Aug. 15, 1958, p. 1419-1425.
(A5; 18-67)

580-A. (Czech.) **Planning of Metallurgical Transport.** Jan Polasek and Emanuel Zelinka. *Hutnické Listy,* v. 13, no. 7, 1958, p. 626-631.
Material transport considerations in choosing locations and laying out metallurgical plants. 5 ref.
(A5a, 18-51, 18-67)

581-A. (German.) **Lead and Zinc World Trends.** W. Macking. *Metall,* v. 12, Aug. 1958, p. 745-750.
(A-general; Pb, Zn)

582-A. (German.) **The U. S. Lead and Zinc Dilemma.** F. A. Pinkerneil. *Metall,* v. 12, Aug. 1958, p. 753-754.
(A4p; Pb, Zn)

583-A. (German.) **Over-Production of Lead and Zinc.** J. Vuillequez. *Metall,* v. 12, Aug. 1958, p. 755.
(A4p; Pb, Zn)

584-A. (German.) **Tariff Policies Concerning Lead, Zinc and Their Alloys.** H. J. Rathlein and H. Schatz. *Metall,* v. 12, Aug. 1958, p. 756-758.
(A4q; Pd, Zn)

585-A. (German.) **World Production of Beryllium.** R. Kerschagl. *Metall,* v. 12, Aug. 1958, p. 762-763.
(A4p; Be)

586-A. (German.) **Decontamination and Neutralization of Industrial Waste.** Erich Lutter. *Metallwaren-Industrie und Galvanotechnik,* v. 49, July 1958, p. 280-297.
Problems encountered in filtering deposits containing Cr compounds. Comparison of different methods now being used. Importance of lowering cost of operation. 36 ref.
(A8b; Cr)

587-A. (German.) **Observations on Operational Practices in American Steel Mills. Pt. 1. Working Habits and Efficiency. Pt. 2. Differences in Organization Practice.** Werner Schütte and Helmut Spitzer. *Stahl und Eisen,* v. 78, June 26, 1958, p. 873-882.
Differences between German and American management and operation practice. 8 ref. (A5; ST)

588-A. (Japanese.) **Choice of Heat Resistant Steel.** Taro Hasegawa. *Metals,* v. 28, July 1958, p. 537-541.
General discussion of heat resistant steel for gas turbines.
(A-general, W11m; SGA-h)

589-A. (Portuguese.) **Present Possibilities for the Manufacture of Sponge Iron in Brazil.** Anchyes C. Lopes. *Engenharia, Mineracao e Metalurgia,* v. 28, July 1958, p. 15-17.
Several Brazilian steel producers could make competatively priced sponge iron using locally available raw materials and fuels. (A11, D8j)

590-A. (Russian.) **Utilization of Secondary Power Resources of the Metallurgical Industry.** V. D. Pashkov. *Stal',* v. 18, July 1958, p. 660-667.
Use of waste furnace gas for developing steam at 2.5 atm. pressure for use in openhearth cooling system; for developing steam at 3-5 atm. for boilers; for gas turbines to increase volume of compressed blast furnace gases. (A11c; Fe, EG-m44)

591-A. Development of ZM41 Magnesium Sheet Alloy. H. A. Johnson and R. D. Masteller. Wright Air Development Center. *U. S. Office of Technical Services,* PB 131417, Sept. 1957, 30 p. $.75.
Alloy system which appears superior to AZ31 has nominal composition of 4% Zn, 1% Mn, 0.7% mischmetal, balance Mg. ZM41 alloy, compared to AZ31, has higher strength, more uniform longitudinal and transverse tensile properties, and a much greater tolerance for iron without corrosion resistance being adversely affected.
(A-general, Q-general; Mg-b, 4-53)

592-A.* **New Titanium Alloys.** (Digest of "Titanium Alloys for Air and Spacecraft", Walter L. Finlay, M. B. Vordahl and R. F. Malone. Presented at Technical Forum, Crucible Steel Co. of America, Pittsburgh, June 26, 1958). *Metal Progess,* v. 74, Sept. 1958, p. 134, 136, 138, 140, 142, 145.
Comparative review of properties and application with special reference to B 120 VCA, C 120AV, C 115 AMoV, C 105VA, and C 135 AMo.
(A-general, Q-general, 17-57; Ti-b)

593-A.* (Russian.) **Physical-Chemical Properties and Fields of Application of Rare Metals.** E. M. Savitskii. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 2-13. (Henry Brutcher, Altadena, Calif., Translation no. 4311.)
Ten-fold increase in production of rare metals in recent years. Application to armaments, aviation, missiles and atomic energy. General review of light rare metals, infusible rare metals, dispersed rare metals, rare earth metals and radioactive rare metals. Application to machine building, chemical, radio-

technical and other branches of industry. 22 ref.
(A-general, 17-57; EG-g)

594-A.* Constitution, Production and Mechanical Properties of Ni-Resist. R. Barton. *British Cast Iron Research Association, Journal,* v. 7, Aug. 1958, p. 299-315.

Constitution, composition, structure and physical and mechanical properties of Ni-Resist, austenitic cast iron. Cupola practice, foundry technique, machining speeds, corrosion resistance, typical applications. 10 ref. (A-general; CI-q; *Ni*)

595-A. Production Control Without Paperwork. *Canadian Metalworking,* v. 21, Sept. 1958, p. 16, 18.

Monitoring production of machinery units and subassembly line, new system records number of parts produced, the time involved and feeds this to centrally-located dispatch room. (A5; 18-74)

596-A. Chemistry and Metallurgy of Titanium. *Engineer,* v. 206, Aug. 29, 1958, p. 334-335.

Properties, applications and heat treatment. (A-general; Ti)

597-A. How Good Plant Layout Cuts Costs. J. L. Martin. *Iron Age,* v. 182, Sept. 25, 1958, p. 85-87.

(A5; 18-67)

598-A. Treat Flue Dust to Recover Iron. John Mitchell and A. C. Sediachek. *Iron Age,* v. 182, Sept. 25, 1958, p. 96-97.

Ferrocoke, a carbonized blend of coal and blast furnace flue dust, is an easy, practical, and technically feasible way to use flue dust.
(A8a, A11d; Fe)

599-A. Air and Water Pollution in the Iron and Steel Industry. A. Parker. *Iron and Steel Institute. Journal,* v. 189, Aug. 1958, p. 297-302.

(A8a, A8b; ST)

600-A. Present and Future Uses of Titanium. Paul M. Tyler. *Metal Progress,* v. 74, Sept. 1958, p. 109-112, 170, 172, 174, 176, 178, 180, 182.

Ti sheet and forgings now cost so much that uses are restricted: 90% of American production goes into jet engines for the Air Force. In a mature industry with integrated plants, costs would be cut to one-fifth, thus opening large new markets in chemical equipment and wheeled vehicles. (A4s, 17-57; Ti)

601-A. Recent Statistics on Metallurgical Education. W. O. Philbrook. *Metal Progress,* v. 74, Sept. 1958, p. 113-114.

Nearly 10% more degrees in metallurgy were granted in 1957 than in 1956. The number of B.S. degrees fell just short of 600 but was up 9.5% over the previous year. Masters, with 176 degrees, were up 8%. Doctors totalled 83, up 9%.
(A3g)

602-A. Silicon: Present and Future. Walter E. Remmers. *Modern Castings,* v. 34, Oct. 1958, p. 47-52.

Current and possible future applications of Si and Si compounds.

(A11c; RM-k)

616-A. The Role of Thorium in the Nuclear Field. John P. Howe. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 1-19.

Nuclear reactions connected with the use of Th; reactor types which can use the material; mode of use in these reactors; requirements and processing of Th-base components; economic factors. 11 ref. (A-general, T11g; Th)

617-A. Hazards Associated With Thorium Metallurgy. A. F. Voigt. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 296-315.

Sources of potential danger confronting personnel who handle Th through metallurgical operations are chemical toxicity, radiological toxicity and fire and explosion hazards. Maximum permissible levels for Th concentration in air. 18 ref. (A7; Th)

618-A. (Pamphlet.) **Charting Steel's Progress.** 69 p. 1958. American Iron and Steel Institute, 150 E. 42nd St., New York 17, N. Y.

Statistical summary of materials, capacity, growth, distribution, wages and working conditions relating to the steel industry in 1957. (A4b)

619-A.* (Book.) **Beryllium Copper.** Copper Development Association, Publication no. 54, 55 South Audley St., London, W. 1, England. 1958. 61 p.

Physical and mechanical properties, resistance to corrosion, foundry practice, working, machining, joining, applications, safe handling. The alloys' strength, hardness and corrosion resistance recommend application as springs, dies, welding electrodes and nonsparking tools. 70 ref. (A-general; Cu-b, *Be*)

620-A. (Book.) **The Metal Thorium.** 397 p. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $10.

Proceedings of the Conference on Thorium held Oct. 11, 1956, at Cleveland, under joint sponsorship of A.E.C. and A.S.M. Papers abstracted separately. (A-general; Th)

621-A. (Book-German.) **Gmelins Handbook of Inorganic Chemistry. Germanium. 8th Ed. System 45. Supplement.** 576 p. 1958. Verlag Chemie, GmbH. Weinheim/Bergstrasse, West Germany. $79.68.

Research for the period 1931-1953. Recovery, refinement and properties, with emphasis on semiconductor applications. (A-general; Ge)

622-A. (Book-German.) **Gmelins Handbook of Inorganic Chemistry. Hafnium. 8th Ed. System 43. Supplement.** 23 p. 1958. Verlag Chemie, GmbH. Weinheim/Bergstrasse, West Germany.

Geochemistry, separation properties. (A-general; Hf)

623-A. (Book-German.) **Gmelins Handbook of Inorganic Chemistry. Zirconium. 8th Ed. System 42.** 448 p. 1958. Verlag Chemie, GmbH. Weinheim/Bergstrasse, West Germany. $63.84.

Historical review, recovery, properties, applications. (A-general; Zr)

624-A.* **Nickel, Including High-Nickel Alloys.** Albert J. Marron, J. J. Moran, Jr., L. M. Petryck and M. D. Bellware. *Industrial and Engineering Chemistry,* v. 50, Sept. 1958, Pt. 2, p. 1460-1469.

Review of 1957-1958 literature. Metallurgy, application, welding and fabrication. 175 ref. (A-general, 11-54; Ni)

625-A. **Properties and Handling Practices for Magnesium: Literature Survey.** M. Beederman, G. A. Bennett, L. Burris, I. G. Dillon, I. O. Winsch, M. W. Nathans, E. Greenberg and J. Wolkoff. Argonne National Laboratory. *U. S. Atomic Energy Commission ANL-5749,* Mar. 1958, 132 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.75.

Cost and availability of various grades of high-purity Mg; safety considerations in handling Mg; materials of construction and industrial handling procedures; methods of production and distillation of Mg; physical and thermodynamic properties; survey of binary and ternary alloys. 200 ref.
(A-general; Mg)

626-A.* **The Application of the Discoveries of Nuclear Physics to the Metallurgical Industry of the USSR.** Paper from "Advances in Steel Technology in 1956", United Nations, 1958, p. 22-48.

Main directions in which the use of radioisotopes and nuclear radiation have been developed are in metallography and physical metallurgy; in the study and control of metallurgical processes such as production of pig iron and steel; and in gamma-radiography for detection of defects and control of technological processes. 89 ref.
(A-general, 1-59; 14-63)

627-A.* (German.) **New Knowledge in the Field of Cast Iron Metallurgy.** W. Herrmann. *Giesserei-Praxis,* no. 16, Aug. 25, 1958, p. 309-310.

Effect of interaction of Fe, C and Si; effect of P and O. Effects of alloying agents on mechanical properties of gray iron. Heat resistant, stress resistant, corrosion resistant and wear resistant cast iron.
(A-general, Q-general, 2-60; CI)

628-A.* **Work Sampling—a Tool for Basic Steel Management.** A. G. Holzman. *Blast Furnace and Steel Plant,* v. 46, Oct. 1958, p. 1070-1074.

Work sampling, also known as ratio-delay study or occurrence study, can be effectively used by basic steel management to obtain reliable information on irregular, noncyclic activities and delays. Computers can be programmed to perform calculations after observations are made. Method was applied to study of three openhearth furnaces during 14 shifts and results compared very well with those of continuous time study over same period. (A5d, D2; ST)

629-A.* **High Strength Steel for Aircraft Applications.** A. J. Lena and E. E. Reynolds. *Blast Furnace and Steel Plant,* v. 46, Oct. 1958, p. 1081-1088.

Including precipitation hardening stainless steels, martensitic hardening stainless steels, cold rolled austenitic stainless steels, hot die toolsteels and superalloys. New methods of evaluation and manufacture. 4 ref. (A-general, T24, 17-57; SS, AY, SGB-a)

630-A.* **Lead as a Corrosion Resistant Material.** *Corrosion Prevention and Control,* v. 5, Sept. 1958, p. 51-52, 54-57.

Extraction and refining techniques; properties and uses of Pb and Pb alloys; effect of alloying additions on mechanical properties; manufactured forms.
(A-general, R-general, 17-57; Pb, SGA-g)

631-A.* **200-Series Stainless Steels.** *Iron Age,* v. 182, Oct. 16, 1958, p. 199-200.

Properties and processes, short-time high-temperature strength, ductility, corrosion resistance, stress cracking, stress-rupture and annealing.
(A-general, Q-general, J23; SS)

632-A.* **Metallurgical Design Considerations for Precipitation-Hardening Steels Up to 1200° F.** F. K. Lampson. *SAE Transactions,* v. 66, 1958, p. 565-573.

Five new alloys—17-7PH, 17-4PH, AM 350, AM 355 and A-286—designed for use up to 1200° F., although long exposure is not feasible above 800° F. Chemistry of each alloy and effect of heat treatment. Although the new alloys are weldable, the metallurgical characteristics must be realized to assure consistent crack-free weldments.
(A-general, 17-51; SS)

633-A.* **Special Alloys Boost Metalworking's Future.** *Steel,* v. 143, Oct. 20, 1958, p. 158-164.

Properties and applications of leaded steels, vacuum melted metals, spring alloys, cast high alloys, Cu alloys, high-temperature alloys, high-strength steels and super-strength steels.
(A-general, Q-general, 17-57; ST, Cu, SS, AY, SGA-h)

634-A.* (French.) **Effects of Intense Radiation From Nuclear Reactors on Materials.** James C. Wilson. *Energie Nucleaire,* v. 2, July-Sept. 1958, p. 207-212.

Examples of known modifications of structure and behavior of irradiated metals; both temporary and long-term changes can occur. Classic testing methods are rejected as invalid for irradiated materials, which undergo such transformations that their properties and the correlations among these properties become those of new and unknown materials. It is suggested that studies of irradiated materials be made at source of radiation (i.e., in the reactor) and during same. 18 ref. (A-general, 2-67)

635-A.* (French.) **Lithium and Its Use.** A. Roos. *Metallurgie et la Construction Mecanique,* v. 90, Sept. 1958, p. 657-663.

Ores and production; Li in the metallurgical industry; Li-Al-Mg alloys. Miscellaneous uses. Vitrifying effect. (A-general; Li)

636-A.* (German.) **Meehanite Cast Iron and Its Significance.** H. Kluge. *Giesserei-Praxis,* v. 18, Sept. 25, 1958, p. 361-365.

Properties: tensile strength, density, hardness, machinability, hardenability, pressure tightness. Major types: general use, heat resistant, wear resistant, corrosion resistant. Tables of mechanical, physical and chemical properties; applications. (A-general, Q-general, 17-57; CI-q)

637-A.* (German.) **Production, Properties and Applications of Super-Pure Aluminum (99.999%).** Hans Schmitt and Walter Koch. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 11, Sept. 1958, p. 427-432.

Production of high-purity Al; disadvantages of graphite electrodes in refining cells; development of cells with metallic terminals. Colorimetric method for determining Si, Cu and Fe in pure Al. Strength, conductivity, corrosion resistance. (A-general, C23, Q-general; Al-a)

638-A.* (Russian.) **Major Iron Ore Deposits in the USSR.** I. S. Shapiro. *Metallurg,* v. 3, Sept. 1958, p. 1-3.

Vast new iron ore deposits uncovered. Resources are estimated at 37 billion tons, or 40% of world resources. Only 15% of ore deposits require no enrichment and these are found in the Krivoirog basin. Their iron content is from 55 to 75%. Deposits in Eastern Siberia have 40% Fe. (A4n; Fe)

639-A. (Rumanian.) **Accomplishments and Prospects of the Mining and Metallurgical Industries of the Rumanian People's Republic.** St. Mantea and Gh. Vanci. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 11-20.

Impressive development of Rumanian industry since second world war, especially during the first 5-year plan, was made possible by development of mining and metallurgy basic industries, by enlargement of the basis of raw materials, by systematic inventory of mineral reserves increased extraction. Production of 1,000,000 tons of briquettes is expected by 1960. Enlargement of plants, development of nuclear industry. (A-general)

640-A. Survey of the Metal Industry. Clement Blazey. *Australasian Engineer,* v. 50, July 7, 1958, p. 48-56.

Technical and economic aspects of metallurgy. 31 ref. (A-general)

641-A. (Russian.) **Origins and First Stages in Development of Blast Furnace Production.** N. I. Krasavtsev. *Metallurg,* v. 3, Aug. 1958, p. 35-37.

Evolution of ironmaking from ancient Chinese practice to 19th Century European developments. (A2, D1; Fe)

642-A. (Slovakian.) **Accident Prevention in Welding.** Pavel Hrbal. *Zvaranie,* v. 7, Aug. 1958, p. 249-251.

(A7p, K-general)

643-A.* Liquefied Petroleum Gases and Their Uses in Metallurgy. C. F. Port. *Metal Treatment and Drop Forging,* v. 25, Sept. 1958, p. 363-368.

Properties and specifications of commercial butane and propane; handling and metallurgical applications. (A-general; RM-m)

644-A.* Zirconium. F. G. Cox. *Welding and Metal Fabrication,* v. 26, Oct. 1958, p. 358-365.

Possibilities as a corrosion resistant material for general use in the chemical industry by virtue of its excellent resistance to alkalies—better than that of Ta, Ti and 18-8 stainless steel—and to most acids. For atomic energy purposes, Zr is particularly useful in water-cooled reactors. General properties, working characteristics, machining, welding and corrosion resistance. 14 ref. (A-general; Zr)

645-A. Lead and Its Alloys. Edward J. Mullarkey. *Industrial and*

Engineering Chemistry, v. 50, Sept. 1958, Pt. 2, p. 1449-1454.

New alloys, corrosion applications in electronics, nuclear reactors, leaded steels. 100 ref.
(A-general, 17-57; Pb-b)

646-A. Less Common Metals. E. M. Sherwood. *Industrial and Engineering Chemistry*, v. 50, Sept. 1958, Pt. 2, p. 1455-1459.

Literature review on zirconium, hafnium, molybdenum, columbium, tantalum, chromium and rhenium. 160 ref. (A-general, 10-54; Cb, Cr, Hf, Mo, Re, Ta, Zr)

647-A. Stainless Steels and Other Ferrous Alloys. W. A. Luce. *Industrial and Engineering Chemistry*, v. 50, Sept. 1958, Pt. 2, p. 1482-1488.

Properties of stainless steel, high-Si iron and Fe-Ni alloys. 135 ref. (A-general, Q-general, 11-54; SS, Fe, Ni, Si)

648-A. Titanium. Howard B. Bomberger. *Industrial and Engineering Chemistry*, v. 50, Sept. 1958, Pt. 2, p. 1493-1495.

Literature review covering production, fabrication, properties and applications. 39 ref.
(A-general; Ti)

649-A. (German.) **Depreciation in Foundries.** H. Herrmann. *Giesserei Praxis*, no. 15, Aug. 10, 1958, p. 298-299.

(A4, A5, W19)

650-A. (Russian.) **Application of Radioactive Isotopes to Ferrous Metallurgy.** L. A. Shvartsman. *Zavodskaya Laboratoriya*, v. 24, no. 8, 1958, p. 915-921.

Use in study of nonmetallic inclusions, particularly during melting and pouring of metals. Value of radioactive calcium isotopes as indicators. Application to study process of steel deoxidation and hydrodynamics of slag formation.
(A-general, 1-59; ST, RM-q)

651-A.* Sources of Columbium. Kenneth B. Higbie. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 10-15.

Nature of ore deposits and reserves of columbium-bearing minerals in Africa, Canada, Europe, South America and U. S. 16 ref. (A11a; Cb)

652-A. Urea From Steel Mill By-Products. *Canadian Chemical Processing*, v. 42, Aug. 1958, p. 51-53.

Cyanamid of Canada will take nitrogen, hydrogen and carbon dioxide from Dofasco's steel operations to make ammonia and urea. (A11c)

653-A. Iron Ore and Other Raw Material Sources for a Primary Iron and Steel Industry in Western Canada. T. H. Janes. *Canadian Mining and Metallurgical Bulletin*, v. 51, Sept. 1958, p. 564-573. (Also in *Transactions*, v. 51, 1958, p. 314-323.)

20 ref. (A11a; Fe, RM-n)

654-A. Silicon Steels for Cores. *Iron Age*, v. 182, Oct. 16, 1958, p. 188, 189.

Review of production, stockpiles, technology. 45 ref. (A4; Ti)

663-A. (Dutch.) **Uses of Nickel-Rich Alloys.** C. Vollers. *Metalen,* v. 13, Aug. 15, 1958, p. 280-281.

(A-general, 17-57; Ni-b)

664-A. (French.) **Niobium and Tantalum, Metals of the Future.** *Echo des Mines et de la Metallurgie,* no. 3519, Aug. 1958, p. 495-497.

(A-general; Cb, Ta)

665-A. (German.) **Regeneration of Sulphuric Acid in Wire Pickling.** Werner Mallach. *Draht,* v. 9, Sept. 1958, p. 335-342.

Mathematical considerations for a simulated system where the regenerating plant is interpolated in the acid circuit. Chemical reactions occurring in pickling; change in density of water-dissolved H_2SO_4 in service; its thermal behavior; solubility of iron sulphate. In the regeneration process, $FeSO_4$ is precipitated by cooling.
(A8b, L12g; 4-61)

666-A. (German.) **Air Contamination and Dust Removal in a Foundry.** Antonio Riggi. *Giesserei,* v. 45, Sept. 11, 1958, p. 575-582.

(A8a, W19)

667-A. (German.) **Use of Blast Furnace Gas in the Synthesis of Hydrocarbons.** Herbert Kolbel. *Stahl und Eisen,* v. 78, Aug. 21, 1958, p. 1165-1169.

Synthesis of hydrocarbons from blast furnace gas and steam.
(A11e, A8a; RM-m39)

668-A. (German.) **Reduction of Iron in an Ancient Bloomery.** Eberhard Schurmann. *Stahl und Eisen,* v. 78, Sept. 18, 1958, p. 1297-1308.

Research on the reduction process of the old-time bloomery hearths, based on analysis of slag found.
(A2, D-general; Fe, RM-q)

669-A.* The U. S. Position as to Resources for the High-Temperature Metals. Richard M. Foose. *SRI Journal,* v. 2, no. 2, 1958, p. 56-63.

The principal candidates for high-temperature service either alone or as alloys are Cb, Ta, Mo, W and Cr. Only with Mo is the United States in a comfortable position. Location of major deposits of each metal; applications. (A-general; SGA-h, Cb, Ta, Mo, W, Cr)

670-A.* (German.) **Precious Metals in Research and Industry.** H. Wolf. *Metall,* v. 12, July 1958, p. 585-593.

Extensive literature survey for last six years on basic chemistry, application of precious metals as tracers and in diffusion studies. Cohesion and vapor pressures as well as electrical properties have enlarged the field considerably. A great number of binary systems with Ag and Pt investigated. Metals like Os, In, Ru, Rh and Pd are advancing and have some advantages over Au, Ag and Pt. 276 ref. (A-general; EG-c31)

671-A.* Removal of Corrosion Products From High Temperature, High Purity Water Systems With an Axial Bed Filter. R. E. Larson and S. L. Williams. *Corrosion,* v. 14, Sept. 1958, p. 44-48.

Concentration of corrosion products and other impurities which produce radionuclides must be maintained at a minimum in the primary coolant systems of nuclear power plants. While resin exchangers remove corrosion products and their radioactive nuclides, high unit cost of resin and the need for large heat exchange unit makes high-temperature purification with low-cost media attractive. Axial bed filter charged with low-cost magnetic iron oxide shows thermal stability and is highly effective. 5 ref. (A8d, W11p, R10g)

672-A. Design and Operation of Hanford's Plutonium Metallurgy Facilities. O. J. Wick and I. D. Thomas. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1903, 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Complete containment within glove boxes is adhered to throughout the entire fabrication process.
(A7r, 17-51; Pu)

673-A.* (French.) **Study of Foundry Production Planning.** Rene Sauquet.

Fonderie, no. 150, July 1958, p. 305-318.

Twenty-eight habitually encountered weaknesses in both office and shop; corrective measures. Considerations are customer satisfaction with delivery, price and quality and efficient plant operation permitting fair profit to be realized on each order. Charts and graphs show suggested handling of orders from moment of receipt until delivery of product. (A5, E-general)

674-A.* (French.) **Accident Prevention in Foundries.** J. Leonard. *Fonderie Belge*, v. 28, Aug. 1958, p. 249-250.

Introduction to statistical study to be presented in eight instalments; figures on accident frequency in Belgian foundries and safety standing as compared to other industries. (A7p, E-general)

675-A.* (Italian.) **Manganese. Pt. 2.** Andrea Ciaccio and Mario L. Savarese. *Industria Mineraria*, v. 9, 2nd Series, June 1958, p. 343-351.

Role of Mn in steelmaking; production of carburized ferromanganese in blast furnaces and electric furnaces; methods of producing low carbon ferromanganese and silicomanganese. Processes used in manufacture of commercially pure Mn. Cost factors in production of various types of ferro-alloys containing Mn and of metallic Mn. Figures on Italian production, importation and export of Mn ores and materials from 1942 through 1957. 19 ref.
(A-general; Mn, AD-n31)

676-A.* (Italian.) **Plastic Working of Sheet Steel. Pt. 1. The Material.** Riccardo Levi. *Rivista di Meccanica*, v. 9, June 21, 1958, p. 51-57.

Metallurgy of steel for presswork applications, rimmed, killed and semikilled steels; normalizing and annealing of sheet product for subsequent plastic working; finish rolling; aging; storing and handling of stock; flatness; dimensional tolerances. (To be continued.)
(A-general, F23, J23; ST, 4-53)

677-A.* Columbium (Niobium) and Tantalum. Pt. 1, General Metallurgy, Occurrences and Uses. D. R. Williamson and Lorraine Burgin. *Colorado School of Mines Mineral Industries Bulletin*, v. 1, Sept. 1958, 12 p.

Composition and distribution of rocks containing Cb and Ta minerals. Concentration methods, processors, prices, metal production and refining, physical properties and uses. 114 ref.
(A11a, A4, C-general; 17-57, Cb, Ta)

678-A.* Two New 1800° F. Alloys for Cast Turbine Blades: Nicrotung, J. T. Brown. DCM Alloy. J. E. Wilson. *Metal Progress*, v. 79, Nov. 1958, p. 83-87.

Both are nickel-base alloys and contain about 4% Al and 3½ to 4% Ti; Nicrotung contains 12% Cr, 10% Co, 8% W, plus B and Zr; DCM has 14 to 16% Cr, about 5% each of Mo and Fe, plus B and Cu. Both are designed for high stress-rupture strength. (A-general, Q-general, 2-62, T7h, 17057; Ni-b, SGA-h)

679-A.* (English.) **Spheroidal Graphite Cast Iron.** *Metalen*, v. 13, May 20, 1958, p. 92-97.

Structural characteristics, mechanical properties, physical properties, resistance to wear, heat and corrosion of spheroidal graphite cast irons in the as-cast or annealed condition. Properties and production characteristics compared with flake graphite irons. (A-general; CI-r)

680-A. Safe Handling of Sodium in Titanium Production. Ted F. Meinhold and Jack Winterhaler. *Chemical Processing*, v. 21, Sept. 1958, p. 76-80.

Economy of the rotary furnace and low-shaft furnace compared. East German iron and steel economy. 17 ref. (A4, D8n; ST)

698-A. (German.) **Utilization of the Waste Heat of a Pusher Furnace Heated With Blast Furnace Gas.**

Hans Weineck. *Stahl und Eisen,* v. 78, Sept. 4, 1958, p. 1246-1251.

Besides the usual air and gas recuperators, a plant for heating with circulating water is added. So, waste gas of less than 300° C. is utilized. (A11e, W17g)

699-A. (German.) **Fifty Years Verlag Stahleisen.** *Stahl und Eisen,* v. 78, Oct. 2, 1958, p. 1361-1364.

(A2; ST)

700-A. (German.) **Steel Defects and Their Causes.** *Technik und Betrieb,* v. 10, July 1958, p. 101-102.

Significance of the upper conversion point in the formation of coarse grain. Reasons for poor wear resistance, corrosion, corrosion fatigue, cavities, surface defects, flaws, hot shortness, scaly surface, band structure. (A-general; ST, 9)

701-A. (German.) **Cost Calculation for Machine Tools.** C. M. Dolezalek. *Werkstattstechnik und Maschinenbau,* v. 48, Sept. 1958, p. 493-496.

(A5f, W25)

702-A. (Polish.) **Prospects of Metallurgical Industry Expansion in Poland Between 1960 and 1975.** Aloyzy Farnik, *Hutnik,* v. 25, No. 6, June 1958, p. 211-216.

Increase of steel production after World War II. Justification and rate of steel production growth. Importance of steel in economical progress of the nations and the world. Possibilities of substitutes for steel. Progress of world production of steel. Steel demand in Poland. Sources of raw materials and their procurement. Present and future trend of steel products manufacture according to their end use. Investment and productivity in metallurgical industry. Import and export of raw materials and Polish steel products. 8 ref. (A4, A11a; ST)

703-A. (Russian.) **Work of the Steelmaking Section of Permanent Commission of Council for Mutual Economic Assistance.** M. A. Pertsev and D. A. Smolyarenko. *Stal',* v. 18, Sept. 1958, p. 793-796.

Conference in Dnetropetrovsk of representatives from Hungary, East Germany, Roumania, Poland and Czechoslovakia which set forth goals for increased steel production for 1958-1960 and 1960-1975. The gathering considered cooperative efforts towards improving quality, better refractory material, and special attention to production of ball-bearing steels. (A-general, A4p; ST)

704-A. (Book.) **Fourth National Symposium on Vacuum Technology, Transactions.** Wilfred G. Matheson. 176 p. 1958. Pergamon Press, 122 E. 55th St., New York 22, N. Y. $12.50.

Fundamental developments of vacuum technology and engineering: new methods and techniques, obtaining high vacuum, instrumentation, controls and other vacuum devices. Production and properties of metals and alloy films. Application of techniques in industry and research. Papers abstracted separately. (A-general, 1-73)

705-A. (Book.) **Physical Metallurgy of Uranium.** A. N. Holden. 262 p. 1958. Addison-Wesley Publishing Co., Inc., Reading, Mass. $10.75.

History, occurrence and preparation; radioactivity and nuclear reactions; crystallography; physical and chemical properties; mechanical properties; deformation; recovery, recrystallization and grain growth; transformations in U and U alloys; growth of single crystals; diffusion in U systems; radiation damage; thermal-cycling growth; design of metallic fuel elements; metallography of U. (A-general; U)

706-A. (Book.) **Technology of Columbium (Niobium).** B. W. Gonser and E. M. Sherwood. 120 p. 1958. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16, N. Y.

Papers presented at symposium arranged by Electrochemical Society, May 1958, considering sources and supply of Cb, extractive methods, impurity analysis, mechanical properties, effect of alloy additions, physical metallurgy and oxidation resistance. Papers abstracted separately. (A-general; Cb)

707-A. (Book.) **Thorium Production Technology.** F. L. Cuthbert. 303 p. 1958. Addison-Wesley Publishing Co., Inc., Reading, Mass. $6.50.

Uses, physical and chemical properties of Th metal and compounds; Th-bearing ores and their concentration; various steps for extracting and purifying the ore and reducing it to the metal; methods for casting and fabrication; health and safety aspects of Th production; chemical and physical methods of testing. 41 ref. (A-general; Th)

708-A. (Book-English.) **English-French and French-English Technical Dictionary.** F. Cusset. 663 p. 1957. Chemical Publishing Co., Inc., 212 Fifth Ave., New York 10, N. Y. $8.

Covers fields of metallurgy, mining, electricity, chemistry, mechanics and sciences. (A-general, 11-67)

709-A. (Book-Russian.) **Metallurgy of the Rare Metals.** I. P. Kislyakov. 232 p. 1957. Metallurgizdat, Moscow, USSR. 6R 40K.

Metallurgy of tungsten, molybdenum, columbium, tantalum, vanadium, titanium, zirconium, thorium and rare earths, uranium, gallium, indium, thallium, germanium, hafnium, rhenium, beryllium, lithium. 159 ref. (A-general; EG-b)

710-A. (Book-Russian.) **Structure and Properties of Aluminum Alloy Extrusions and Stampings.** S. M. Voronov. 248 p. Moskovskii Aviatsionny Tekhnologicheskii Institut, Moscow, USSR.

24 ref. (A-general; Al-b, 4-58, 4-59)

711-A Safety in the Foundry. H. P. Millar. *British Foundryman,* v. 51, Aug. 1958, p. 374-384.

7 ref. (A7p, E-general)

728-A. Columbium-Treated Steels, Low-Cost, High Strength. F. Weston Starratt. *Journal of Metals,* v. 10, Dec. 1958, p. 799.

Additions of 0.01 to 0.036% Cb change the solidification mechanism of mild-carbon steels to produce a fine-grained structure, characteristic of tough, high-strength steels, previously produced by costly heat treatment or alloy additions. (A-general, M27, 2-60, 2-64; CN, Cb)

729-A. Nuclear Metals Opens New Laboratory. *Journal of Metals,* v. 10, Dec. 1958, p. 803.

Current research activities. (A9h, T11g)

SECTION B

RAW MATERIALS and ORE PREPARATION

1-B. Some General Chemical Principles in Extraction of Metals From Low-Grade Ores. A. J. E. Welch. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 1-14.

Review of a number of recent processes in which chemical concentration methods are predominantly applied to low-grade ores; general pattern of such processes; unit-process steps needing more fundamental study. 24 ref.
(B14, C19; RM-n)

2-B. Chemical and Physical Concentration of Uranium Ores. S. W. F. Patching. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 107-118.

22 ref. (B13, B14; U, RM-n)

3-B. Pilot Plant Concentration of Mindola Uranium Ore. M. L. Fitzgerald and D. F. Kelsall. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 163-174.

Removal of carbonates by a straight grinding and flotation circuit, with provision for the incorporation of gravity scalping.
(B13, B14h; U, RM-n)

4-B. Flotation of Vanadium Ore From the Abenab West Mine of the South West Africa Co. M. G. Fleming. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 212-257. (CMA)

The ores are vanadinite and descloizite in a gangue of ferruginous clay, iron oxides, dolomite, calcite and quartz; 40% is finer than 200 mesh. Xanthates were chosen as collectors. Xanthate concentration, relative flotability of minerals, and sodium carbonate concentration.
(B14h, V, RM-n)

5-B. (Russian.) **Automation of Several Aggregates in a Sintering Plant.** I. M. Ravikovich. *Stal'*, v. 17, May 1957, p. 385-388. (Translation in *Iron and Coal Trades Review*, v. 175, Aug. 9, 1957, p. 323-325.)

Automation assures even distribution of the charge among the various units while constant height of the burden is maintained. If the chute clogs or belt breaks the conveyor is stopped and a device protects the conveyor belt from hot returns.
(B16a, 1-52, W12r; Fe, RM-n)

6-B. (Russian.) **Treatment of High-Silicon Ores in Rotary Kilns.** V. Kyuncher and I. Shleier. *Stal'*, v. 17, May 1957, p. 392-401.

Low-grade acidic ores may be treated more economically in rotary kilns than by roasting-magnetic or wet mechanical methods of beneficiation; ores with a definite free silica content can be worked at a lower cost than in low-stack furnaces. 5 ref.
(B15, W15a, 1-52; Fe, *Si*, RM-n)

7-B. (Russian.) **Effect of Mineralogical Composition of Molybdenum Concentrates on the Roasting Process.** T. P. Khazanova, N. P. Lyakishev and E. A. Grishankova. *Stal'*, v. 17, May 1957, p. 425-429.

It is expedient to add missing mineralogical constituents to molybdenum concentrates to bring them up to standard requirements for obtaining uniform results in roasting. The minerals considered are calcite, chalcopyrite, quartz, galena, feldspar, hematite.
(B15; Mo, RM-n, NM-e)

8-B. Dry Magnetic Concentration. P. E. Cavanagh and E. W. Williams. *Canadian Mining and Metallurgical Bulletin,* v. 50, Sept. 1957, p. 558-564. (Also, *Transactions,* v. 50, 1957, p. 326-332.)

Results of pilot-plant study on concentration of magnetite iron ore in a dry state by means of magnetic concentrators. (B14j; Fe, RM-n)

9-B. Exploration and Development of the Sedimentary Iron Ores of Missouri. William C. Hayes. *Information Circular No. 14.* State of Missouri, Dept. of Business and Administration, Division of Geological Survey and Water Resources. 1957, p. 1-33.

15 ref. (B general; Fe, RM-n)

10-B. Lime Addition and Pulp Consistency in Gold Ore Milling. G. Chad Norris. *Institution of Mining and Metallurgy, Bulletin,* no. 610, Sept. 1957, p. 597-611.

Addition of lime to process in form of milk-of-lime prepared by slaking quicklime with excess water resulted in more efficient use of lime and smoother ball-mill and classifier operation than intermittent addition of lime as quicklime ahead of grinding mills. Milk-of-lime additions are preferably made at several points in process, each appropriate to next stage, in ore treatment. 9 ref. (B13c; Au, RM-8)

11-B. Uranium Ore Processing. Richard H. Kennedy. *Mines Magazine,* v. 47, Sept. 1957, p. 22-25, 38.

(B14; U, RM-n)

12-B. Consolidated Denison Mines, Ltd. *Mines Magazine,* v. 47, Sept. 1957, p. 63-64.

Uranium mining at Quirke Lake, Northern Ontario. (B12; U)

13-B. Innovations in Processing Uranium Ores. J. B. Rosenbaum, W. L. Lennemann and J. B. Clemmer. *Mining Engineering,* v. 9, Sept. 1957, p. 976-981.

Beneficiation by attrition grinding and lime flotation. Flow sheets on U extraction, including solvent extraction of sulphuric acid eluate, char-in-pulp system, pressure oxidation leaching, hydrogen precipitation from soda ash solution, thick slurry solvent extraction, ammonium carbonate leaching and nonaqueous extraction. 6 ref. (B13, B14, C19; U, RM-n)

14-B. (German.) **Application of New Flocculants for the Improvement of the Clarification and Filtering of German Ores.** Martin Clement. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 10, Sept. 1957, p. 421-427.

Besides organic and inorganic electrolytes, highly polymeric substances such as Separan, Aerofloc and DT 120 were found to be advantageous for clarifying and filtering ores as well as for faster coagulation and sedimentation. 12 ref. (B14q; RM-n)

15-B. (German.) **Agglomeration of Iron Ore Fines in Vacuum Extrusion Presses.** Manfred Häuser. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 10, Sept. 1957, p. 443-450.

A series of experiments were carried out on a particularly difficult bog iron ore, with the object of obtaining satisfactory lump sizes. Various additions such as cement, limestone and coke breeze were tested. (B14; Fe, RM-n)

16-B. Portfolio of Flowsheets. *Canadian Mining Manual,* 1957, p. 149-207.

Flowsheets covering Au, Ag, Ag-C, Fe ore, base metals, U processes at various Canadian mines. (B13, B14, B15)

17-B. Selected Annotated Bibliography of Thorium and Rare-Earth Deposits in the United States Including Alaska. K. L. Buck. *U. S. Atomic Energy Commission,* GSB-1019-F, 1957, 28 p. (CMA)

(B general; Th, EG-g)

26-B.* Sinter-Bed Ignition. H. Bates. *Iron and Steel Institute, Journal,* v. 187, Dec. 1957, p. 310-314.

Variables affecting sinter-bed ignition and hence the strength of the sinter from the top layer of the bed. There is an optimum rate of heat input and percentage of excess air for ignition and an increase in the moisture content or the particle size of the top of the bed results in a decrease in the sinter strength. A total heat input of 4000 Btu. per sq. ft. was found to be sufficient for both the lean home and rich foreign ore mixes used. (B16a; Fe, RM-n)

51-B.* Fundamental Researches Into the Iron Ore Sintering Process. R. Wild. *Imperial College Chemical Engineering Society, Journal,* v. 10, 1956, p. 33-50.

Laboratory sintering technique using inert materials was developed. Study of temperature distribution and time for completion of sintering in relation to bulk density of material used, gives basis for concept of a relatively constant air requirement for sintering unit weight of mix. Use of a wide range of water and calcium carbonate in the mixes clarified relationship between fuel needed and chemical reactions involved. Over-riding influence of heat transfer in the sintering process demonstrated; air required for sintering is largely governed by relative heat capacities of solid particles and the air. Use of fuels with different reactivities and atmospheres with different oxygen contents shows that maximum efficiency is obtained when heat transfer rate and rate of fuel combustion are correctly matched. 22 ref. (B16a; Fe)

52-B.* Metallurgical Practice at the Cam and Motor. *Mining Journal,* v. 249, Nov. 22, 1957, p. 612-613.

Concentration processes; cyanide plant at mine of Southern Rhodesia's largest Au producer. Ore is refractory to cyanide treatment and requires roasting. Plant treats 800 tons of ore per day. (B14, B15; Au)

53-B. Concentration of Beach Sands From Taree, N. S. W. S. B. Hudson. *University of Melbourne—Ore Dressing Investigations,* Report no. 529, Apr. 1957, 10 p.

Electrostatic and magnetic separation applied to a gravity concentrate yielded rutile concentrates assaying 96.0% TiO and recovering 94% of the rutile in the head sample, and a zircon concentrate assaying 99.2% zircon and recovering 92% of the zircon in the head sample. (B14j, B14n; Ti, Zr)

54-B. Treatment of Copper Tailings From Lloyd Mine, Burraga, N.S.W. J. T. Woodcock. *University of Melbourne, Ore Dressing Investigations,* Report no. 530, Apr. 1957, 18 p.

After desliming, treatment of sand by percolation to extract oxide copper was satisfactory. Grinding and flotation of leach residue satisfactorily recovered the sulphide copper. Over-all recovery from classifier sand was 93% or 63% of the Cu in the original feed. (B14, Cu)

55-B. Recovery of Monazite From Weakly Magnetic Beach Sand Minerals From Swansea, N.S.W. S. B. Hudson. *University of Melbourne, Ore Dressing Investigations,* Report no. 542, Sept. 1957, 12 p.

Over 96% of the monazite in the weakly magnetic fraction derived from dry treatment of a beach sand concentrate can be recovered in concentrates assaying 92.3% monazite, by using table concentration and magnetic and electrostatic separation of the table concentrate and redressing of the tailings. (B14; Th)

56-B.* (French.) Influence of Grain Size on the Kinetics of Contraction

of Agglomerates of Ex-Carbonyl Iron During Roasting in the Alpha Phase. Georges Cizeron. *Comptes Rendus,* v. 245, Dec. 4, 1957, p. 2051-2054.

Kinetics of contraction of agglomerates of ex-carbonyl iron can be greatly modified by varying temperature during a single roasting operation. Speed of densification can be accelerated or retarded by having second part of treatment take place at higher or lower temperature than that used at beginning of roasting. This phenomenon is closely related to variation in grain size. 4 ref. (B15, 2-59; Fe)

63-B.* How Molten Aluminum Affects Plastic Refractories. H. A. McDonald, J. E. Dore and W. S. Peterson. *Journal of Metals,* v. 10, Jan. 1958, p. 35-37.

Three plastic refractory, alumina-silica compositions containing Al_2O_3, were compounded and rammed. Samples of each composition were fired to 1600, 1800 and 2000° F., and one 85% Al_2O_3 piece was fired to 2400° F. Test pieces were then exposed to 7075 Al alloy at 1400° F. for 168 hr. Resistance of a plastic refractory to attack and penetration by molten Al is a function of the uncalcined clay content of the material, and the phase changes in the clay wrought by prefiring. (B19d; Al, 14-60, RM-h)

69-B.* How Theory Can Help Make More Sinter. E. W. Voice and R. Wild. *Journal of Metals,* v. 10, Feb. 1958, p. 105-110.

Investigation by British Iron and Steel Research Assoc. concludes that while the fuel requirements are related to the heat requirements of the process, the air requirements are much more dependent on the heat

capacity of the sinter mix than on the oxygen requirement of the fuel. A series of fronts travel down the bed during sintering; water evaporation, calcination, heat transfer and combustion. The efficiency of the process depends on these fronts traveling down the bed correctly phased with respect to each other. 6 ref.
(B16, A11e)

70-B.* Updraft Pelletizing of Specular-Hematite Concentrates. Donald C. Violetta. *Journal of Metals,* v. 10, Feb. 1958, p. 118-121.

Updraft method rather than the conventional downdraft method provides several distinct advantages; there is no apparent limit of the maximum bed depth. Individual balling capacities are a fractional part of the traveling grate capacity, hence a specific balling device can form specific sizes of pellets, with particular quantities of fuel, and this charge can be placed in a specific location in the pellet bed. All operations of firing, such as drying, preheating, ignition, combustion, recuperation and cooling within the bed are conducted simultaneously.
(B16b; Fe)

71-B. Downdraft Taconite Pellet Hardening. Alan English and M. F. Morgan. *Journal of Metals,* v. 10, Feb. 1958, p. 122-124.

Raw materials used in both the experimental and the commercial plants were similar and consisted of magnetic taconite concentrates, anthracite fines, bentonite and fuel oil. The main principle of pelletizing with the downdraft continuous-grate furnace, which embodies some of the features of a sintering machine, is the recovery and use of most of the sensible heat for drying and burning the product.
(B16b, 1-52; Fe)

72-B. Pelletizing in Shaft Furnaces. F. D. DeVaney. *Journal of Metals,* v. 10, Feb. 1958, p. 125-128.

Furnace at Erie Mining Co. consists of a rectangular shaft 6 ft. wide, 14 ft. long and approximately 45 ft. high. The shaft is full at all times with pellets and an amount is drawn off from the bottom at the same rate the green balls are fed into the top, so as to keep the feed line uniform. The amount of pellets in the furnace is about 180 long tons, and these move continuously down the shaft at a rate of ½ to 1 in. per min., depending on the feed rate. (B16b, 1-52)

73-B. Lurgi Pelletizing Process: A Combined Updraft-Downdraft Technique. Kurt J. E. Meyer and Hans Rausch. *Journal of Metals,* v. 10, Feb. 1958, p. 129-133.

Special features of the Lurgi pelletizing process are that addition of binders is not necessary and gas or oil is used exclusively as fuel not incorporated in the pellets. The latter permits greater control of temperature and oxidizing conditions on sintering machine. Magnetite, hematite, limonite, or mixtures of these may be pelletized by this process.

(B19)

103-B. Intergranular Comminution by Heating. J. H. Brown, A. M. Gaudin and C. M. Loeb, Jr. *Mining Engineering,* v. 10, Apr. 1958, p. 490-496.

Tests on granite, syenite, taconite and marble. 13 ref. (B13; Fe, RM-n)

104-B. (Russian.) **Mechanism of Pellet Strengthening on Burning.** A. N. Pokhvisnev and B. A. Savel'ev. *Stal',* Feb. 1958, p. 104-109.

Burning of pellets of magnetite concentrates in atmosphere of increased oxygen content results in complete oxidation at top rate of magnetite grains and their conversion into hematite grains. Pellets should be kept at maximum temperature for completion of recrystallization of hematite grains. (B16a; Fe)

105-B. (Russian.) **Testing of Unburnt Magnesite-Chromite Bricks for Open-hearth Roofs.** B. P. Okhrimovich, A. E. Pribytkov, A. I. Uzberg and P. A. Rumm. *Stal',* Feb. 1958, p. 126-130.

Intensity of wear of unburnt magnesite-chromite bricks is only slightly higher than that of burnt bricks, while the cost is only half as great and the process of production of unburnt bricks is considerably simpler. (B19d, D2; RM-h38)

106-B. (Russian.) **Decarburization of Solid Ferrochrome Under Vacuum.** I. D. Kirichenko. *Stal',* Feb. 1958, p. 131-137.

Decarbonization under vacuum by means of iron ore or by previously oxidized ferrochrome makes possible the production of an inexpensive low-silicon and carbonless ferrochrome containing 0.01-0.3% carbon. (B-general, 1-73; Cr, AD-n31)

107-B. Effect of Roasting on Recovery of Uranium and Vanadium

From Carnotite Ores by Carbonate Leaching. J. Halpern, F. A. Forward and A. H. Ross. *AIME Transactions,* v. 212, Feb. 1958, p. 65-70.

Effect of roasting carnotite ores in the presence of various reagents on subsequent recoveries of U and V by carbonate leaching. An attempt to account for the results in terms of the chemical reactions that occur during the roast treatment. 8 ref. (B15, C19n; U, V)

108-B. Sinter Roasting of Lead-Rich Galena Concentrates at the Electrothermic Lead Plant of the Ronnskar Works, Sweden. S. J. Wallden, N. B. Lindvall and K. G. Gorling. *AIME Transactions,* v. 212, Apr. 1958, p. 146-153.

New method and plant for pelletizing and sintering lead concentrates with 70-80% Pb contents. 7 ref. (B16, B15, Pb)

109-B.* Production of Self-Fluxing Sinter. J. S. McMahan. *Blast Furnace and Steel Plant,* v. 46, Apr. 1958, p. 373-376.

Adding 18% dolomite fines to the sinter mixture increased blast furnace production rate about 8½% and lowered coke rate about 6½%. Sinter plant production rates higher when making dolomitic sinter. Dolomitic sinter more pliable and softer than regular sinter.
(B16a, D1; Fe, RM-n)

110-B. Appleby-Frodingham Sinter Plants. B. L. Robertson and R. H. Siddons. *Iron and Coal Trades Review,* v. 176, Mar. 28, 1958, p. 739-750.

Some important factors governing sinter plant performance. Fan operation and circulating load, for example, have been isolated and examined and a method of plant rating worked out. 5 ref.
(B16, W13e, D1a; Fe, RM-n)

111-B. Electric Furnace Refractories. E. C. Wright. *Metal Progress,* v. 73, May 1958, p. 87-88.

Refractory slurries are poured into forms around electrode parts; self-curing mixes are made with additions of silicon metal powder and sodium silicate whose reaction generates enough heat to set and dry the rammed refractory.
(B19, D5; RM-h)

148-B.* (Italian.) **Refractoriness Tests on a Part of the System CaO-MgO-SiO_2-Al_2O_3.** R. Zoja. *Metallurgia Italiana,* v. 50, Mar. 1958, p. 85-90.

Spherical test pieces composed of two half-spheres 20 mm. in diameter, fitted together, were placed in tapered cavities in preheated disk of refractory material. Disks were held at desired temperature (varying between 1350 and 1550° C. for different runs) for 20 min., and agglomeration, softening and melting of specimens was observed. Systems tested were those having 5% and 10% Al_2O_3, 10% to 50% SiO, 25% to 80% MgO and 5% to 35% CaO. (B19d)

149-B.* (Italian.) **Possibilities of X-Ray Diffraction Analysis of Refractories.** E. Moltoni and G. Giuseppetti. *Metallurgia Italiana,* v. 50, Mar. 1958, p. 91-100.

Advantages of X-ray diffraction study of silica, alumina-silica, dolomite, magnesite and special refractories for determination of crystal size, structure, composition, texture, impurities and speed of conversion. Tabulation of powder spectra of 54

crystalline compounds having refractory interest. 47 ref. (B19d)

150-B.* (Italian.) **Investigation of the Resistance of an Alumina-Silica Refractory to Sudden Cooling Tests.** L. Massimilla and S. Bracale. *Metallurgia Italiana,* v. 50, Mar. 1958, p. 101-105.

Both theory of maximum stress and Weibull statistical theory are shown to provide reliable data on resistance of panels of refractory brick to thermal cycles when mathematical results are compared with those obtained by actual testing. In case studied, material resisted fracture when subjected to sudden temperature drops from 600 to 20° C. Drops from higher temperatures caused fracture even though cooling was gradual. 6 ref. (B19d)

151-B. High-Temperature Strength of Basic Refractories. E. I. Greaves and J. MacKenzie. *British Ceramic Society, Transactions,* v. 57, Apr. 1958, p. 187-198.

A good correlation exists between high-temperature strength, creep characteristics and service performance of openhearth furnace roofs. (B19d, D2; RM-h)

103 ref. (B14, 3-74)

175-B. Problems in Sinter Production. L. I. Kharash. *Stal',* v. 17, no. 2, 1957, p. 106-114. (Iron and Steel Institute Translation no. 761.)

Previously abstracted from original. See item 129-B, 1957. (B16a; Fe)

176-B.* (Japanese.) A Method of Testing the Endurability of Refractory Brick. Shoji Tomita. *Japan Foundrymen's Society,* v. 30, May 1958, p. 418-426.

Endurance of cupola brick is closely related to its resistance to slag erosion; spalling resistance has a considerable effect on its en-

durance; endurance of the brick is highly dependent upon the heating temperature in the cupola; Agalmatolite brick, under the proper conditions, has highest endurance as cupola brick. (B19d, W18d)

177-B. (English.) **New Aluminum-Bearing Minerals in Bauxites.** S. I. Beneslavsky. *Academy of Sciences of the USSR, Proceedings,* v. 113, 1957, p. 367-369.

Aluminum is found in the composition of some minerals of iron oxide and hydroxide, which are the chief components of the nonsoluble residues of bauxite. (B-general; Al)

178-B* (German.) **Contribution to the Study of Flotation Kinetics.** I. Huber Panu. *Revue de Métallurgie (Bucarest),* v. 1, 1956, p. 112-120.

New flotation kinetics formulas express the variation of the extraction of the useful substance and of the flotation velocity as a function of time, the formulas taking into account the actual conditions under which the flotation is effected. 3 ref. (B14h)

179-B.* (German.) **Chemical Reactions of Sulphur in Coal During the Coking Process. An Investigation With the Help of Radioactive Isotope S^{35}.** Hanns Jurgen Reintjes. *Archiv für das Eisenhüttenwesen,* v. 29, May 1958, p. 283-291.

S^{35} added to coal in the form of calcium sulphate and pyrite, and the distribution of sulphur in coal among the degassing products was studied. Reactions of pyrites and sulphates were measured directly while the organic sulphur was determined through different calculations. Tables show sulphur distribution activity measurements and their evaluation. Testing apparatus. (B17g, 1-59; *S*)

Solid-solid, solid-liquid, solid-gas, liquid-liquid, liquid-gas and gas-gas systems with a chapter on separation and purification in nuclear engineering. (B14, C19, C28, A8a)

194-B.* (Italian.) **Influence of Composition of Mixes on Sintering Characteristics.** G. Sironi. *Metallurgia Italiana,* v. 50, May 1958, p. 181-190.

Study of sintering mixes based on magnetite and purple ore. A 50-50 mixture of these materials provided sinter of best strength and reducibility. Substitution of lignite for coke as fuel element impaired these characteristics. Self-fluxing sinters based on same 50-50 mix plus limestone additions gave about 10% less sinter product, as well as less satisfactory particle size and strength; however, reducibility was equal to that of product not containing limestone, and became appreciably higher as basicity was increased. Strength of self-fluxing sinter can be somewhat improved by adding rolling mill scale to sintering burden. (B16a; Fe)

The agglomerate consisted of Fe_3O_4, Fe_2O_3, SiO_2 quartz and CaO. Increase of combustibles by 5% leads to formation of fayalites and to eutectoid fusion of the oxides. (B16, N9; Fe)

203-B.* (German.) **Dimensions of Flotation Cells: Effects of Dispersion and Suspension.** Werner Gruder. *Zeitschrift fur Erzbergbau und Metallhuttenwesen*, v. 11, July 1958, p. 310-319.

Flotation depends on aeration. The stirrer produces suspension by agitating the mixture and dispersion by mixing with air. The height of the flotation cell has no influence on the yield, which depends only on the aeration. The agitation increases not only with the speed of the stirrer, but is also determined by the ratio of diameter of stirrer to width of cell. (B14h)

(B-general; Fe)

206-B.* (Russian.) **Properties of Fluxed Sinters.** N. L. Goldshtein and N. S. Khromchenko. *Stal'*, v. 18, July 1958, p. 586-593.

Reducibility of sinter is determined mainly by temperature and thermal level of sintering process as well as by gang content in sinter blend. These factors may be defined by the share of bivalent iron in total iron content of sinter. The usual increase in reducibility of high basicity sinter is also explained by lowering of the temperature and thermal level of sintering process when using fluxed sinter blends. Conclusions are based on study of 100 samples of fluxed sinters with varying chemical composition. 18 ref. (B16a, D1; Fe)

Various methods for preparing iron ore burden so as to increase capacity of existing blast furnaces and reduce coke consumption. Sizing, sintering, enriching of iron ore from the Minette area, the Midlands, Sweden and the U. S. Extensive test results recorded in diagrams showing coke consumption in relation to percent of sintered ore in the burden, blast temperatures and pressures, flow resistance in relation to pellet size and percent Fe in ore or sinter. 30 ref. (B13, B14, B16; Fe)

216-B.* **Experience With Sinter Burden in Swedish Blast Furnaces.** Ulf Notini. *Iron and Steel Institute, Journal,* v. 189, Aug. 1958, p. 322-326.

Coke consumption reduced by 20 to 25% with sinter because of its improved reducibility and a fusion zone rich in iron and higher blast temperatures. Self-fluxing sinter gave coke saving of 10 to 15%. Increased output as much as 250% for charcoal furnaces and 100% for coke blast furnaces. Use of sinters sometimes increased tendency for charge to hang leading to slips. (B16a, D1a; Fe)

217-B.* (Russian.) **Pelletizing Iron Ores and Concentrates.** N. A. Yarkho. *Metallurg,* v. 3, Aug. 1958, p. 3-8.

Advantages of pelletizing over agglomeration of ores: greater gas permeability; more readily reduced; greater mechanical strength; easier

to transport. Most effective method of pelletizing is preliminary compression of the ore under vacuum and then placing in drums and roasting. This results in stronger, more uniform lumps. A chemical-catalyst method is used to enrich lumps with carbon and flux, and $CaCO_3$. (B16b; Fe)

218-B. Sintering: 5000 Tons a Day. *Metal Progress,* v. 74, Sept. 1958, p. 74-77.

U. S. Steel's new sintering plant is virtually automatic in operation. The strong porous cake provides a more effective blast furnace burden. Furthermore, the ore supply is indirectly increased because fines formerly lost are used to make the sinter. (B16a, D1; Fe)

219-B. Factors Influencing Flotation in Tin Ore Dressing. *Mining Journal,* v. 251, Aug. 29, 1958, p. 222-223.

224-B.* Fluosolids Roasting of Dowa's Yanahara Sulfides. Hidesaburo Kurushima and R. M. Foley. *Mining Engineering,* v. 10, Oct. 1958, p. 1057-1061.

Fluosolids treatment of pyrrhotite has given a profitable return on Cu, sulphuric acid and iron ore. Ore is crushed to $-\frac{1}{2}$ in. and conveyed to the ball mill. Feed and water additions to the grinding circuit are controlled so that a 70 to 75% solids slurry is produced. Two air-operated pumps deliver the feed to the 20-ft. I.D. fluosolids reactor. Roasting air is supplied to the windbox of the reactor at 7400 cu. ft. per min. and 5 psi. The dust-laden gas leaving the reactor passes through two stages of cyclone collectors, a balloon flue and a hot Cottrell for dust removal. (B15q; Cu, Fe)

225-B.* (Rumanian.) **Variation of the Flotation Indices as Function of the Duration of the Process When It Is a Question of Producing a Single Concentrate.** Huber Panu and Bujar Georgescu. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 149-172.

In a previous study, Mr. Panu derived formulas for variations as function of time of two technological indices of flotation, namely, extraction of useful substance m and flotation speed w. The present work gives formulas for other technological indices: extraction of concentrate v, contents in useful substances c of the concentrate, and the yield η of the flotation. By these formulas, one can find the variation of flotation indices as a function of time if the constants of the formulas are determined by a flotation test in which the concentrate is collected in the form of one or two fractions, depending on whether the mineral is disassociated or not. 5 ref. (B14h)

226-B. British Magnesia Comes of Age. *British Steelmaker,* v. 24, Oct. 1958, p. 326-328.

SECTION C

NONFERROUS EXTRACTION and REFINING

1-C. Solvent Extraction Separation of Uranium and Plutonium From Fission Products. F. L. Culler and J. R. Flanary. *First Nuclear Engineering and Science Congress,* v. 2, 1957, p. 84-87.

A solution of tri-*n*-butyl in refined kerosene extracts uranium (VI) and plutonium (IV) from a nitric acid solution of irradiated uranium, leaving the bulk of the fission products in the aqueous phase. (C19; U, Pu)

2-C. Processing of Irradiated Thorium. A. T. Gresky. *First Nuclear Engineering and Science Congress,* v. 2, 1957, p. 88-95.

A method for processing the thorium blanket of a thermal breeder reactor recovers more than 99% of the thorium and U^{233} and separates them from each other and fission products by a factor of 10,000. (C28, A11p; Th, U)

3-C. Uranium Processing Using Uranium Hexafluoride. Herbert H. Hyman, Irving Sheft and Joseph J. Katz. *First Nuclear Engineering and Science Congress,* v. 2, 1957, p. 144-149.

Bromine trifluoride may be used in the preparation of uranium hexafluoride from fuel elements, ore concentrates or waste slags; dissolution and decontamination procedures. (C1p; U)

4-C. Extraction of Protactinium From Solid Thorium Fluoride. R. H. Wiswall, Jr., R. J. Heus and F. T. Miles. *First Nuclear Engineering and Science Congress,* v. 2, 1957, p. 164-169.

Removal of protactinium tracer from thorium fluoride powder by treatment with gaseous fluorine. Kinetics analyzed in terms of a solid-state diffusion process accompanied by a slow change in the properties of the solid. (C1p; Pa)

5-C. Melting and Fabrication of Binary Alloys of Uranium With Molybdenum, Niobium and Silicon. F. R. Lorenz, W. B. Haynes, E. S. Foster. *First Nuclear Engineering and Science Congress,* v. 1, 1957, p. 176-185.

Vacuum induction melting and consumable electrode arc melting combined into a duplex melting technique producing sound, homogeneous alloy ingots of about 50 lb.; furnaces and accessories used. Working by extrusion, forging, rolling and swaging. (C5h, C5j, 1-73, F general; U, *Mo, Cb, Si*)

6-C. Method for the Production of Titanium-Aluminum Alloys by Reduction of Titanium Oxide. L. F. Mondolfo and A. Roy. *Light Metal Age,* v. 15, Oct. 1957, p. 11-16.

Alloy is treated with Mg or a Mg-Zn alloy to leach out the excess Al until a Ti-Al alloy of low aluminum content is obtained. Distillation removes the leaching reagent. (To be continued.) (C19n; Ti, Al)

7-C. Operation of a Pulse Column for the Production of Hafnium-Free Zirconium. J. B. Robinson and H. T. Tupper. *U. S. Atomic Energy Commission,* KT-70, May 26, 1950, 13 p. (CMA)

Hafnium thiocyanate complexes were extracted in the course of producing hafnium-free zirconium by liquid-liquid extraction at the Y-12 plant. An unpacked column 60 ft. high was considered inconvenient so a pilot study was made to shorten it. Data on the effect of pulse frequency and through-put are tabulated. (C19; Zr, Hf)

8-C. Filtration of Thiocyanic Acid Condensation Products in the Zirconium-Hafnium Separation Plant. G. R. Jansy and H. T. Tupper. *U. S.*

Atomic Energy Commission, KT-71, June 20, 1950, 10 p. (CMA)

To remove the solid condensates forming at the interfaces of extraction and scrubbing towers for the thiocyanate separation of hafnium from zirconium, a filter press was used with a choice of two filter aids. Effectiveness of the system was determined by the percentage of solids removed; diatomaceous earth is the better filter aid. (C19p, 1-52; Zr, Hf)

9-C. Induction Melting Process for Titanium Scrap. P. J. Ahearn and C. F. Frey. U. S. Watertown Arsenal, Report 10/12. *U. S. Office of Technical Services,* PB 131241, Apr. 1957, 11 p. (CMA)

A number of 20 to 25-lb. Ti ingots were prepared from Ti-6Al-4V scrap. The heats were melted in a high-frequency induction furnace under an inert atmosphere. Contamination by the graphite crucible was minimized by use of a titanium skull in the bottom of the crucible. (C5j; Ti, RM-p)

10-C. Purification by Solvent Extraction. J. M. Fletcher. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 15-33.

Three types of solvent extraction; the merits of solvent extraction compared with those of other methods; particular examples using tributyl phosphate as the organic solvent. 11 ref. (C19; RM-n)

11-C. Studies in the Chlorination of Some Complex Ores—Wolframite, Vanadinite and Chromite. E. A. Pokorny. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 34-48.

The use of varying mixtures of chlorine and hydrogen added another variant—the dissociation of the chlorides and oxy-chlorides—thus increasing the scope of chlorination and in some circumstances leading to a certain selectivity of the action of chlorine. (C19r; W, V, Cr, RM-n)

12-C. An Oxide-Chloride Conversion Process for the Extraction of Certain Metals. A. R. Gibson and J. H. Buddery. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 49-71.

A method whereby some metallic oxides may be converted to chlorides in solution in alkali or alkaline earth chlorides. A fluid melt substantially oxygen-free is generated, from which metal may be precipitated and recovered. Chemical actions involved and theory based on experiments with uranium dioxide and thoria. 5 ref. (C19r; U)

13-C. Metallurgical Developments in the Recovery of Some of the Less Common Metals in Canada. L. E. Djingheuzian. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 72-95.

Columbium, tantalum, lithium, selenium and tellurium. 28 ref. (C general; Cb, Ta, Li, Se, Te)

14-C. Extraction of Some Less Common Metals From Smelter and Refinery Intermediates at La Oroya, Peru (Selenium, Tellurium and Thallium). W. E. Koeppel and A. K. Schellinger. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 96-106.

Recovery of Se and Te from anode residue plant cupel dusts and slags under high-altitude conditions. Thallium from lead blast furnace fume traced through the cadmium plant circuit; extraction from leach solutions. Production of high-purity thallium from dichromate precipitate. (C21; Se, Te, Tl)

15-C. Recovery of Uranium From Sulphate Leach Solutions by Anion Exchange. T. V. Arden. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 119-142.

Precipitation methods proposed or tested; modern ion exchange plants. 14 ref. (C19s; U)

16-C. Factors Influencing the Magnesium Reduction of Uranium Tetrafluoride. J. Harper and A. E. Williams. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 143-162.

Experimental work for up to 5 kg. uranium. Side reactions which can influence the efficiency of the process and the quality of the metal billet. A technique which gives a high-density uranium billet. 4 ref. (C26; U)

17-C. Processes for the Extraction of Vanadium. C. Tyzack and P. G. England. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 175-195. (CMA)

Two methods studied: In one, ferrovanadium is chlorinated to VCl_4, which was separated from the other impurity chlorides, decomposed to VCl_3 and reduced by hydrogen to VCl_2; hydrogen reduction to vanadium by a fluid bed technique. The other method is the calcium reduction of the oxides under inert atmosphere. Iodine or sulphur is used as a booster. The calcium system has the greatest economic advantage. 4 ref. (C19r, C26; V)

18-C. Production of High-Purity Vanadium Metal. E. Foley, M. Ward and A. L. Hock. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 196-211. (CMA)

Theory suggests that magnesium reduction of a suitable vanadium chloride should be a sound basis for producing the metal. Ferrovanadium is chlorinated to VCl_4, decomposed in refluxing to VCl_3, and reduced in argon at 850° C. Byproducts and excess reductant are distilled off under argon and vacuum. The sponge produced is 99.7% V. 70 ref. (C26; V-a, 6-74)

19-C. Selection of Process for Development for the Production of Pure Niobium. G. K. Dickson and J. A. Dukes. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 258-271.

The chemistry of five separate processes and relative costs. (C general; Cb-a)

20-C. Extraction of Pure Niobium by a Chlorination Process. A. B. McIntosh and J. S. Broadley. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 272-286.

New process for extracting pure Cb from its ores or ferrocolumbium by chlorination and hydrogen reduction. Separation of Ta from Cb on a pilot-plant scale by preferential hydrogen reduction of the mixed Cb and Ta pentachloride. (C19r; Cb, Ta)

21-C. Distillation of Volatile Chlorides as a Means of Obtaining Pure Niobium. B. R. Steele and D. Geldart. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 287-309.

Separation of Cb from Ta, W and Fe by fractionation of their volatile chlorides is a convenient means of obtaining pure Cb which could easily be developed to a plant scale. Equipment and theory. (C22; Cb)

22-C. Beryllium Production at Milford Haven. P. S. Bryant. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 310-322.

Stages of the process from conditioning of the ore to purification of the hydroxide and recovery of beryllium from effluent liquors and slurries. Production of hydroxide-carbon briquettes and crude beryllium chloride and its purification; electrolysis of fused chloride and leaching of the cathode deposit. (C23; Be)

23-C. Preparation of Beryllium Metal by Thermal Reduction of the Fluoride. L. J. Derham and D. A. Temple. Paper from "Extraction and Refining of the Rarer Metals," Institution of Metals, 1957, p. 323-336.

Beryllium hydroxide is reacted with ammonium bifluoride and ammonium fluoberyllate is crystallized out by evaporation. The crystals are then decomposed in a graphite retort at 850° C. Ammonium fluoride is sublimed from the retort, beryllium fluoride being tapped as a molten anhydrous glass into graphite molds. The beryllium fluoride is crushed, mixed with high-purity magnesium and reduced in a graphite crucible at 900° C. The charge is heated to above 1283° C., cooled and the melted beryllium separated. 20 ref. (C1p; Be)

24-C. Purification of Metals by Intermediate Formation of Their Stable Halide Vapours With Application to Beryllium and Titanium. P. Gross and D. L. Levi. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 337-350.

Metals of which vapor pressures are too low for their evaporation at practicable temperatures may be distilled by a reversible endothermic reaction; conditions of the reactions and factors influencing purity of the distillate. Beryllium and titanium as examples. 4 ref. (C22h; Be, Ti)

25-C. Extraction of Thorium From Monazite. A. Audsley, R. Lind and P. G. England. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 351-380.

Purification processes based on chlorination and on solvent extraction of concentrates prepared from the rock by sulphuric acid breakdown. The products of these purification processes are then reduced to metal by calcium. 19 ref. (C19r, C26; Th, RM-n)

26-C. Some Investigations Into the Extraction of Titanium by Fused Salt Electrolysis. F. L. Bett, et al. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 381-401. (CMA)

Electrolysis of titanium chlorides in fused salts. $TiCl_3$ may be prepared separately or in the electrolyte; use of soluble anodes; electrolytic cell design. 17 ref. (C23n, 1-52; Ti)

27-C. The Manufacture of Hafnium-Free Zirconium. F. Hudswell and J. M. Hutcheon. Paper from "Extraction and Refining of the Rarer Metals," Institution of Mining and Metallurgy, 1957, p. 402-419. (CMA)

Separation methods, including fractional crystallization of potassium fluorozirconate and fluorohafnate, vapor-phase dechlorination, fractional distillation of alkoxides, chromatography on paper pulp or silica gel,, cationic or anionic exchange, and liquid-liquid with TBP and with methyl isobutyl ketone and HCNS. 22 ref. (C28; Zr)

28-C. Treatment of Auriferous Roasted Product From Victorian Antimony Mines, Costerfield, Victoria. J. T. Woodcock. Commonwealth of Australia, Commonwealth Scientific and Industrial Research Organization and the Mining Department, University of Melbourne, Ore Dressing Investigations Report No. 524, Feb. 1957, 24 p.

An antimony-gold ore assaying 8 dwt. per ton Au, 8% Sb, and 1% S was investigated after special roasting treatment. Best extraction of Au obtained was by direct amalgamation in absence of lime, with recovery up to 40%. Less satisfactory results were obtained by amalgamation in presence of lime, direct cyanidation, fine grinding plus agitation, cyanidation with pre-aeration or prior alkali leaching, flotation. 6 ref. (C29, C19, B14; Au, RM-n)

29-C. Treatment of Auriferous Battery Tailings From Black Cameron Mine, Queenstown, Victoria. J. T. Woodcock. Commonwealth of Australia, Commonwealth Scientific and Industrial Research Organization and the Mining Department, University of Melbourne, Ore Dressing Investigations Report No. 525, Feb. 1957, 6 p.

Sample of tailings studied contained 2.75 dwt. per ton gold and a little pyrite. No coarse gold was present and amalgamation recovered very little gold. Direct cyanidation extracted 66%; extraction could be increased to 79% by regrinding to 66% finer than 200 mesh. (C19p, C29; Au)

30-C. (Italian.) Zone Melting Method for Refining of Metals. T. Federighi. *Alluminio,* v. 26, Sept. 1957, p. 361-366.

Principles and practical considerations, including shape of specimen, length of melted zone, number of zones, rate and method of travel of zone or heat source, heating methods, specimen carriers, floating-zone technique, atmosphere. Extension of technique to homogenization and study of eutectics in complex phase diagrams; possible uses of superpure metals; zone melting as an aid to study of physical and mechanical properties of metals. 35 ref. (C28k, M24)

31-C. Separation of Zirconium and Hafnium By Differential Reduction of Their Tetrachlorides. I. E. Newnham. *American Chemical Society, Journal,* v. 79, Oct. 1957, p. 5415-5417. (CMA) (C28; Zr, Hf)

32-C. Continuous Cold Trap for Fluoride Volatility Processing of Uranium. J. C. Bresee and P. R. Larson. *Industrial and Engineering Chemistry,* v. 49, Sept. 1957, p. 1349-1354.

Enriched uranium is recovered from heterogeneous reactor fuel by low-pressure volatility process using fluidized continuous condenser. 9 ref. (C22; U)

33-C. Vacuum Dezincing of Parkes' Process Zinc Crusts. V. F. Leferrer. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Nov. 1957, p. 1459-1460. (C28, 1-73; Zn, *Pb, Ag*)

34-C. Cominco Operations. John Grinrod. *Mine and Quarry Engineering,* v. 23, Oct. 1957, p. 432-439.

Activities of the Consolidated Mining and Smelting Co. of Canada Ltd. (C general, B general; Pb, Zn)

35-C. Uranium Recovery by Continuous Countercurrent Ion Exchange. E. L. Rau. *Mines Magazine,* v. 47, Sept. 1957, p. 39-41, 59. (C19s; U)

36-C. Columnar Ion Exchange—Resin-in-Pulp — Solvent Extraction. Colorado School of Mines Research Foundation Inc. *Mining Engineering,* v. 9, Sept. 1957, p. 973.

Methods of recovering U. (C19; U)

37-C. Recent Trends in Extracting Uranium. Frederick B. Brien. *Mining Engineering,* v. 9, Sept. 1957, p. 974-975.

Preconcentration, leaching, solution purification, solution concentration, precipitation and analysis. 14 ref. (C19, B14; U)

38-C. Atmospheric Versus Pressure Leaching of Uranium Ores. R. G. Beverly, A. W. Griffith and W. A. Millsap. *Mining Engineering,* v. 9, Sept. 1957, p. 982-988.

Chemistry and flow sheet of hot sodium carbonate, sodium bicarbonate extraction; uranium-bearing solution separated from solid residue by filtration and uranium precipitated from solutions. Data from pilot plant study on effect of pressures and temperatures on percentage extraction and leach time. 10 ref. (C19; U, RM-n)

39-C. Ammonium Carbonate Pressure Leaching of Uranium Ores. B. G. Langston, R. D. Macdonald and F. M. Stephens, Jr. *Mining Engineering,* v. 9, Sept. 1957, p. 989-993.

Leaching conditions; chemistry of process; effect of temperature, pressure, oxidation, ammonium carbonate and bicarbonate concentration; advantages compared to sodium carbonate leaching. (C19n; U, RM-n)

40-C. Solvent Extraction of Uranium at Shiprock, N. M. W. C. Hazen and A. V. Henrickson. *Mining Engineering,* v. 9, Sept. 1957, p. 994-996.

Circuit and operation of plant utilizing di-2-ethyl hexyl phosphoric acid and tributyl phosphate dissolved in kerosene to extract U from acid leach liquor; uranium-laden solvent stripped with sodium carbonate solutions and carbonate solutions acidified and uranium precipitated with ammonia or magnesia. (C19; U)

41-C. Solvent Extraction. Newcomer to the Colorado Plateau. A. M. Ross. *Mining Engineering,* v. 9, Sept. 1957, p. 997-1000.

Advantages of solvent extraction for recovering U from acid leach solution; alkyl amines compared to alkyl phosphates. 12 ref. (C19; U)

42-C. Continuous Countercurrent Ion Exchange in Hydrometallurgical Separators. Clement K. Chase. *Mining Engineering,* v. 9, Sept. 1957, p. 1001-1003.

Advantages in using continuous countercurrent resin slurry operation for extraction of uranium from alkaline or acid leach liquors. (C19s; U)

43-C. Recovery of Uranium From Lignites. Edward S. Porter and Henry G. Petrow. *Mining Engineering,* v. 9, Sept. 1957, p. 1004-1006.

Pilot plant study of roasting, leaching and solvent extraction. 6 ref. (C19, B15; U, RM-n)

44-C.* Subaquatic Casting of Aluminum Ingots. Ichiji Obinata and Hiroshi Tanaka. *American Society for Metals, Transactions,* v. 51, Preprint no. 67, 1957, 23 p.

Method of making ingots by casting molten Al and its alloys in thin-walled metal molds set in hot water (SAC process). Sound ingots of fine and homogeneous equiaxed structure are obtained. While there exists no marked difference between SAC and chill ingots in the physical and chemical properties, the mechanical properties of the former are somewhat superior to those of the latter. 7 ref. (C5; Al, 5-59)

45-C.* Isolation and Separation of Niobium and Tantalum Pentoxides From Mineral Concentrates by Liquid-Liquid Extraction. G. H. Faye and W. R. Inman. *Canadian Mining and Metallurgical Bulletin,* v. 50, Oct. 1957, p. 606-613. (Also, *Transactions,* v. 60, 1957, p. 343-347.)

Methods successfully used on laboratory scale for recovery of Cb and Ta, pentoxides from concentrates of Canadian pyrochlore ores containing 3 to 20% Cb oxide and small amounts of Ta. Method uses hydrochloric nitric acid mixture for acid decomposition and extraction by means of methyl isobutyl ketone. 6 ref. (C19; Cb, Ta)

46-C.* Contribution of Ion Exchange to Nuclear Technology. L. D. Roland. *Chemical and Process Engineering,* v. 38, Sept. 1957, p. 367-371.

Description of process and explanation of chemistry of ion exchange; operation of a 3-column U extraction plant, of a resin-in-pulp extraction system; nuclear reactor water treatment methods, waste disposal technique; ion exchange process of sep-

aration of Hf from Zr and types of disposal plants.
(C19s, A8b; Zr, Hf)

47-C.* Refractories and Mould Materials for Vacuum Melting and Casting. H. O. McIntire. *Foundry Trade Journal,* v. 103, Nov. 7, 1957, p. 543-548.

Alloys that benefit particularly by vacuum melting include the Ni-base alloys (which contain appreciable amounts of Al and Ti), high-alumina iron-base alloys such as Thermenol, and certain grades of steel where the greatest possible freedom from nonmetallic inclusions is needed. Considerable success has been achieved with refractories commonly used for melting and casting in air at normal pressures. 6 ref.
(C25, D8m, 1-73; RM-h, Ni, ST)

48-C.* Removal of Lead From Copper in Fire Refining. J. E. Stolarczyk, A. Cibula, P. Gregory and R. W. Ruddle. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 49-58.

New phosphate treatment in which additions of phosphor-copper are made to the oxidized copper melt in the ratio of two parts of phosphor to one part of lead to be removed. Pb is precipitated in the melt as globules of Cu-Pb phosphate which quickly rise to the surface of the bath. 9 ref.
(C21; Pb, Cu, RM-q)

49-C.* Removal of Lead and Tin From Copper in Fire Refining. J. E. Stolarczyk and R. W. Ruddle. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 59-64.

Slags composed of silica, iron oxide and phosphorus pentoxide were efficient. Slag consisting of 70% sodium carbonate and 30% calcium oxide efficiently removed low (0.02%) concentrations of tin. Best conditions for the use of this slag. 4 ref. (C21; Cu, Pb, Sn, RM-q)

50-C. Low-Cost Method Strengthens Iron Ore Pellets. *Iron Age,* v. 180, Nov. 21, 1957, p. 130-131.
(B16b; Fe, RM-n, 6-67)

51-C.* Preparation of Uranium Metal by Fused Salt Electrolysis. G. Meister and W. C. Lilliendahl. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Nov. 1957, p. 1445-1447.

Uranium metal with a purity of about 99.9% was produced on a large scale by fused salt electrolysis with a material efficiency of about 90%. Efficiency depends mainly on bath composition, electrolysis temperature, electrode smothering and elutriation during washing of the powder. 5 ref. (C23; U)

52-C. Method for the Production of Titanium-Aluminum Alloys by Reduction of Titanium Oxide. L. F. Mondolfo and A. Roy. *Light Metal Age,* v. 15, Oct. 1957, p. 11-12, 14, 16. (CMA)

IIT method of producing Ti-Al alloys by reducing TiO_2 with Al.
(C26; Ti, Al)

53-C.* Direct Chill Casting of Large Aluminum Ingots. A. T. Taylor, D. H. Thompson and J. J. Wegner. *Metal Progress,* v. 72, Nov. 1957, p. 70-74.

Interrupted quenching is incorporated in the D. C. process to produce sound castings in sizes large enough to provide billets for huge forging and extrusion presses. A simple air blast device interrupts the flow of quenching water.
(C5, N12; Al, 5-59)

54-C.* Production of Zinc in a Blast Furnace. S. W. K. Morgan. *Metallurgia,* v. 56, Sept. 1957, p. 115-120.

Process for smelting Zn whereby furnace gases which contain 5 to 6% Zn and 8 to 10% CO_2 are brought into contact with shower of molten Pb which condenses 89% Zn vapor, allowing recovery as metal; remaining 11% recovered as dross from condenser; process useful for smelting Pb-Zn concentrates as well as high-grade Zn concentrates; Pb recovered as bullion. 13 ref.
(C21a; Zn, Pb)

55-C.* Effect of Roasting on Recovery of Uranium and Vanadium From Carnotite Ores by Carbonate Leaching. J. Halpern, F. A. Forward and A. H. Ross. *Mining Engineering,* 9, *AIME Transactions,* v. 208, Oct. 1957, p. 1129-1134.

Chemical aspects and effect of prior roasting procedures on recovery. 8 ref. (C19n, B15; U, V)

56-C. Zirconium for Nuclear Reactors. I. E. Newnham. *Research,* v. 10, Nov. 1957, p. 424-428. (CMA)

A new hafnium separation method is proposed on the basis of a differential reducibility of the tetrachlorides of the metals.
(C19r, T11q, 17-57; Zr)

57-C. Non-Aqueous Processing—an Introduction. S. Lawroski. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 479-497.

General discussion on fluoride volatility and pyrometallurgical processes. 8 ref. (C21, C22, A11d, T11g)

58-C. Fluoride Volatility Processes for Low Alloy Fuels. R. C. Vogel and R. K. Steunenberg. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 498-559.

Application of processes to irradated fuel elements consisting of natural or slightly enriched U-containing fission products and Pu of recoverable amounts. Blanket materials in the future may be of a similar nature. 11 ref.
(C22, A11d, T11q; U, Pu)

59-C. Fluoride Volatility Process for High Alloy Fuels. G. I. Cathers. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 560-575.

Development work on the fused salt—fluoride volatility process being carried out at Argonne and Oak Ridge National Laboratories. Covers fused salt dissolution and fluorination work in addition to sodium fluoride absorption as a proposed new technique for decontaminating and handling the product UF_6.
(C22, A11d, T11q; U)

60-C. Engineering and Economic Considerations of Volatility Processes. Pt. 1. Engineering. R. W. Kessie, S. Lawroski, M. Levenson, R. C. Lumatainen, W. J. Mecham, W. A. Rodger, W. B. Seefeldt, G. J. Vogel and G. E. Goring. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 576-612.

Corrosion is the predominant consideration in selecting materials; summarizes corrosion studies on the environments of the various process operations. (C22, R general, T11g)

61-C. Engineering and Economic Considerations of Volatility Processes. Pt. 2. Economics. O. J. DuTemple, W. J. Mecham and G. J. Vogel. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 613-666.

Comparison with existing solvent processes. 32 ref. (C22, A11d, T11g)

62-C. Chemistry of Pyrometallurgical Processes: A Review. Harold M. Feder. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 667-718.

Separation of U, Pu, Th, fission elements or other unwanted elements from each other in whatever combination they may occur and to whatever extent is required in connection with neutron reaction technology. 77 ref.
(C21, A11d, T11g; U, Pu, Th)

63-C. Pyrometallurgical Process; Process and Equipment Development. E. Motta, D. Sinizer, G. Brand, J. Foltz, W. Gardner, J. Ballif, J. Guon, G. Kendall, T. Luebben and K. Mattern. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 710-747.

Various furnaces for extracting fission products or Pu from molten fuel; systems related to the refabrication into fuel elements of the partially decontaminated and reconstituted fuel alloys. 3 ref. (C21, 1-52, A11d, T11g)

64-C. Pyrometallurgical Processing: Economics and Proposed Engineering Applications. J. H. Schraidt, W. A. Rodger, M. Levenson, S. Lawroski, D. C. Hampson, J. Graae, L. F. Coleman, L. Burris, Jr., G. J. Bernstein and G. A. Bennett. Paper from "Symposium on Reprocessing of Irradiated Fuels." Book 2. *U. S. Atomic Energy Commission,* TID-7534, p. 748-804.

Savings are expected by reduction of fuel inventory through rapid processing, use of simple, compact processes requiring no chemical conversion, recovery of expensive alloying agents, and simplification of waste disposal and criticality problems. 27 ref. (C21, A11d, T11g)

65-C. (French.) Preparation of Zirconium and of Some Zirconium Alloys by Fused Salt Electrolysis. Jean-Lucien Andrieux and Jeanne Dauphin. *Comptes Rendus,* v. 245, Oct. 21, 1957, p. 1359-1362. (CMA)

Only electrolytes containing $CaCl_2$ and alkali chloride such as KCl or NaCl gave zirconium in a spongelike form. 12 ref. (C23; Zr)

66-C. (French.) Manufacture of Light Alloys Plates for Stamping. Martial

Renouard and Yves Bresson. *Revue de l'Aluminium,* no. 246, Sept. 1957, p. 833-841.

A minimum isotropy is required in plates used in stamping processes. Semicontinuous casting brings about preferential orientations in the slabs. Annealing gives the required isotropy for Al-Mn alloys. With usual Al alloys, either the semi-continuous casting process must be modified or a homogenization treatment used. (C5, G3; Al, *Mn*)

Process for production of Th by fused salt electrolysis. Preparation of anhydrous oxide-free thorium chloride. Electrolysis of this salt in molten sodium chloride and removal of granular coarsely crystalline Th. Structure and mechanical properties of product Th. 30 ref.
(C23p; Th)

88-C. Dissolution of Pyrite Ores in Acid Chlorine Solutions. M. I. Sherman and J. D. H. Strickland. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1386-1388.

Apparatus and technique for measuring rate of dissolution in iron sulphide or in chlorine water. Results obtained shown only ferric ions and sulphate ions were produced and reaction is diffusion controlled with energy of activation of about 5000 cal. per mole. 17 ref.
(C19n, P13a; Fe, RM-n)

89-C. (Japanese.) Titanium Enrichment in Aluminum-Titanium Alloys by Aluminum Monochloride. Kiyoaki Obara and Fumio Mochizuki. *Light Metals (Tokyo),* v. 7. Sept. 1957, p. 5-9.

13 ref. (C19; Al, *Ti*)

90-C. For Higher Purity Metals. *Chemical and Engineering News,* v. 36, Feb. 10, 1958, p. 51-52.

Electron bombardment melting points the way to cheaper Ti, ductile Cb. (C5k; Cb, Ti)

91-C. Extracting Uranium. *Metal Industry,* v. 92, Jan. 10, 1958, p. 30-32.

Process for solvent extraction from acid leach liquors.
(C19n; U)

92-C.* (Italian.) **Contribution to the Industrial Refining of Zinc by Zone Melting.** G. Scacciati and P. Gondi. *Metallurgia Italiana,* v. 49, Nov. 1957, p. 774-782.

Theoretical limits of removal of Pb only from electrolytic Zn determined by laboratory tests. Quantities of about 100 kg. were then processed to determine optimum operating conditions, power consumption and practical limit of purity possible in industrial application. 14 ref. (C28k; Zn, *Pb*)

93-C.* **Chemical Engineering in the Nuclear Power Industry.** J. M. Kay. *Imperial College Chemical Engineering Society, Journal,* v. 10, 1956, p. 7-12.

Processes involved in extraction of U from ores and fabrication into fuel elements; processing of irradiated fuel. (C19, A11d, T11g; U, 14-70)

94-C. **Production of Hafnium. Pt. 1.** H. P. Holmes, M. M. Barr and H. L. Gilbert. *Industrial Heating,* v. 25, Jan. 1958, p. 44-50.

(C19; Hf)

95-C.* **Recovery of Nickel From Spent Nickel Catalyst.** K. E. Bharucha, J. G. Kane and D. Rebello. *Journal of Scientific and Industrial Research,* v. 16, Section A, Sept. 1957, p. 415-419.

Processes involving digestion with sulphuric, nitric, hydrochloric, formic or acetic acids. 10 ref.
(C19, A11d, T29d; Ni)

96-C.* **Uranium Recovery for Spent Fuel by Dissolution in Fused Salt and Fluorination.** G. I. Cathers. *Nuclear Science and Engineering,* v. 2, Nov. 1957, p. 768-777.

Promising nonaqueous process consists of dissolution of the fuel element in a fluoride melt by hydrofluorination at 600 to 700° C., direct fluorination for the production and volatilization of UF_6, with further decontamination of the UF_6 from fission product activity secured in an NaF absorption-desorption step. Good decontamination is obtained in the fluorination step due to the low volatility of most of the fission product fluorides. An over-all decontamination factor greater than 10^6 with adequate U recovery has been demonstrated. A pilot plant has been constructed for testing the process with various heterogeneous fuel elements. 4 ref.
(C19a, A11d, T11g; U, 14-70)

97-C. **A Critique of Vacuum Methods.** *Steel,* v. 142, Jan. 13, 1958, p. 79-81, 84.

Outstanding features of various methods of melting and specific applications. (C25, C5, D8m, 1-73)

98-C. **Production of High Purity Chromium From Fluoride Containing Electrolytes.** N. E. Ryan. *Australian Aeronautical Research Laboratories, Report Met. 26,* Jan. 13, 1958, 15 p.

Main requirements for efficient electrodeposition. 7 ref. (C23p; Cr)

Experiments include work with material heavily doped with Zn, Cd, Te and As. Several lines of evidence show that the important acceptor impurities Zn and Cd are volatile from molten indium antimonide. The removal of acceptors by volatilization under appropriate experimental conditions, followed by zone refining, can yield material with less than 10^{14} excess donors per cc. 7 ref. (C28k; In, Sb)

120-C. Recovery of Vanadium From Colorado Plateau Ores by Solvent Extraction. David A. Ellis. Dow Chemical Co. *U. S. Atomic Energy Commission,* DOW-161, Sept. 1, 1957, 51 p. (Available at U. S. Office of Technical Services, $1.50.)

(C19n; U, V)

121-C.* (German.) **Settling Behavior of Copper Matte and Copper in Liquid Slags.** F. Johannsen and W. Wiese. *Zeitschrift für Erzbergbau und Metallhüttenwesen,* v. 11, Jan. 1958, p. 2-14.

Stokes' Law governs, which means that the settling speed depends on the size of the drops of the sulphides or of the Cu, on the viscosity of the slag and the difference in the specific weights between the liquid phases. Liquid Cu does not wet solid oxides and therefore forms round drops. The large drops forming in the melting of a sulphide-containing burden advance more rapidly through the layer of slag than small drops and can absorb the latter with increase in volume. 29 ref.
(C21b; Cu, RM-q)

122-C. **Second Look at Hot Salts. What Happens When a Metal Dissolves in Its Own Molten Halide?** *Chemical and Engineering News,* v. 36, Mar. 24, 1958, p. 34.

(C1p; Ni, Co)

123-C. **Preparation of Bismuth for Use in a Liquid-Metal Fueled Reactor.** G. W. Horsley. *Journal of Nuclear Energy,* v. 6, no. 1-2, 1957, p. 41-52.

Analysis of pile neutron capture cross-section (38-39 m barns) of samples of commercial refined Bi indicate that chlorine is the most deleterious impurity. Study of bismuth-oxygen-chlorine system suggests that concentration of this element may be reduced to about 13 ppm. by oxidation and filtration, the residual chlorine remaining in solution as bismuth oxychloride. 9 ref.
(C28j, P18j, T11g, 17-57; Bi)

124-C.* **Titanium Technology. Pt. 1.** R. L. Jaffee. *Modern Metals,* v. 14, Feb. 1958, p. 46-54.

Production methods, ore reserves, melting and casting. Problems involved in re-using scrap.
(C-general, A11a, A11d; Ti)

125-C. **Melting and Casting of Uranium.** N. D. Baines and E. Mason. *United Kingdom Atomic Energy Authority,* IGR.TN/C.710, Dec. 1957, 7 p.

Investigations into the production of homogeneous casts in respect to grain size and composition, casting to size, assessment of factors likely to influence grain size (including effect of ultrasonics on solidification) and prevention of contamination during melting. (C5, 1-74; U)

126-C. **Concurrent Vacuum Distillation Between Crucible Tungsten and Charge.** L. E. Preuss. Paper from *"1956 National Symposium on Vacuum Technology",* p. 127-146.

Investigation of the differential evaporation between W crucible material and Au and Cr distilland described for the empirical conditions of vacuum distillation. 31 ref.
(C22, 1-73, W18h)

127-C. **A Study of Melting and Refining Molybdenum and Columbium by the Vacuum Arc Cast Process.** E. D. Sayre and A. J. Stoph. Paper from *"1956 National Symposium on Vacuum Technology",* p. 175-181.

132-C.* **Melting and Casting of Uranium, Zirconium, Niobium Alloys.** J. E. Baird and N. J. Carson. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 31-37.

Vacuum induction melting and casting of uranium alloys containing 5% Zr and 1.5% Cb, into cores for nuclear reactor fuel elements. Ingot soundness, mold design and melting practice. (C5j, 1-73, T11g; U, *Zr, Cb*)

133-C.* **Arc Melting of Uranium-Rich Alloys.** W. H. Britton and W. B. Haynes. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 63-66.

Major problems in application of arc melting technique to U-Mo and U-Cb alloys include control of macrosegregation and removal of contaminants. Notes limited production use and suggests possible future developments. 4 ref. (C5h; U, *Mo, Cb*)

134-C.* **Various Methods of Preparing Uranium Dioxide for Fuel Ele-**

ment Use. C. M. Henderson, G. W. Tompkin and D. E. Rhodes. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 123-130.

Numerous chemical methods. Production of uranium dioxide from uranium hexafluoride. Effect of various physical treatments applied to uranium dioxide powders on particle size and density of sintered compacts.
(C19, C1p, H-general, T11g; U, 14-68)

135-C.* (Portuguese.) **Direct Electrolytic Refining of Black Copper.** Ivo Jordan. *ABM, Boletim da Associasao Brasileira de Metais,* v. 13, Oct. 1957, p. 287-318.

Electrolytic refining of Cu with anodes of black Cu produced by direct fusion in water-jacketed furnace, without recourse to intermediate treatment in anode furnace. Deposits of 99.99% pure Cu were obtained on starting sheets of electrolytic Cu formed by electrodeposition on stainless steel. Experiments were conducted on laboratory scale with electrodes of various compositions. Effect of voltage between electrodes, cathodic current output, characteristics of cathodes produced and of anodic slime. 8 ref. (C23p; Cu)

136-C. (Rumanian.) **Contribution to the Study of the Electrolytic Refining of Phosphorus-Nickel Alloys. I.** Atanasiu, A. Calasaru and Mira Popescu. *Revista de Chimie,* v. 9, Jan. 1958, p. 8-13.

(C23p; Ni, *P*)

137-C.* **Continuous Rod and Tube Casting.** *Metalworking Production,* Dec. 27, 1957, p. 2303-2309.

The Solicast process for continuous casting of phosphor bronze and steel rod and tube. Longer rods with uniform hardness can be produced.
(C5q; Cu-s, ST, 4-55, 4-60)

138-C. (Czech.) **Preparation of Zirconium by Reduction of Zirconium Tetrachloride and by Electrolysis of Potassium Zirconium Fluoride.** Frantisek Plzak and Vaclav Klabik. *Hutnické Listy,* v. 13, Jan. 1958, p. 26-33. 12 ref. (C23, C22j; Zr)

139-C.* (German.) **Refining of Aluminum Melts.** H. Riedelbauch. *Aluminium,* v. 34, Mar. 1958, p. 130-134.

Chlorine and nitrogen refining are effective, convenient and trouble-free if the proposed gases are replaced by salt mixtures of equivalent activity. Theory and methods of grain refining. 19 ref. (C21; Al)

140-C. (Hungarian.) **Developments in Magnesium Metallurgy.** Andor Szulyovszky. *Kohaszati Lapok,* v. 12, Jan-Feb. 1958, p. 66-70.

In countries having dolomite as a source of Mg, thermal process is more efficient and economical than electrolytic process. Thermal process is reduction of magnesium oxide at high temperature with an agent having greater chemical affinity for oxygen than Mg, such as carbon, silicon and calcium carbide. 4 ref.
(C23, C26, Mg; *C, Si, Ca*)

141-C. **Alloys From Oxides.** Nicholas Martini. *Chemical and Engineering News,* v. 30, Apr. 21, 1958, p. 59-60.

Induction furnace process for Mo, Ti, Hf, Cb, Ta, Cr and W. (C21d, 1-69; Mo, Ti, Hf, Cb, Ta, Cr, W)

142-C. **Process Refines Nickel.** *Chemical and Engineering News,* v. 36, Apr. 21, 1958, p. 60.

Direct electrolysis of Ni matte.
(C23n; Ni)

143-C. **Processing Monazite.** John Barghusen. *Chemical and Engineering News,* v. 36, Apr. 21, 1958, p. 61-62.

Process for obtaining uranium-free Th at a reasonable cost.
(C19n; Th, Ce, EG-g)

144-C.* **Vacuum Melted High-Temperature Alloys.** *Metal Industry,* v. 92, no. 4, Jan. 24, 1958, p. 63-66.

New processing technique has permitted increased operating temperatures in jet engines by its effect on high-temperature strength and ductility. Chemical composition and heat treatments for J-1570, GMR-235, Udimet 500, M-252 and Waspaloy. Tensile and stress-rupture tests; effect of B and Zr additions on rupture life.
(C25, Q27, Q3; SGA-h)

145-C. **Vacuum Melted Metals.** *Metal Industry,* v. 92, Jan. 31, 1958, p. 95-96.

Production of Ti, Zr and their alloys. (C25, Ti, Zr)

146-C. **Mechanism of Formation of Zirconium Sponge in the Magnesiothermal Production of Zirconium.** F. G. Reshetnikov and E. N. Oblomeev. *Atomnaya Energiya,* v. 3, 1957, no. 5, p. 459-462. (Henry Brutcher, Altadena, Calif., Translation no. 4055.)

Previously abstracted from original. See item 202-C, 1957.

147-C. (French.) **Electrolytic Separation of Hafnium and Zirconium by Means of Fused Salts.** G. Chauvin,

H. Coriou and J. Huré. *Métaux-Corrosion-Industries,* v. 23, Dec. 1957, p. 469-474.

Melting of NaCl (65%) and K_2ZrF_6 (35%) at 850° C. and electrolytic separation of Hf and Zr in an argon atmosphere. 6 ref. (C23p; Hf, Zr)

148-C.* (German.) **Industrial Experiments in the Production of Oxygen-Free Copper.** Hans Eckstein. *Neue Hütte,* v. 3, Jan. 1958, p. 32-36.

Causes of gases in electrolytic and refined Cu. Deoxidation must be performed at the same time as dehydration; deoxidizing agents. Method using charcoal filter and nitrogen as protective gas can produce Cu with oxygen content below 0.0003% and specific weight of 8.7. Another process gives oxygen-free Cu with oxygen content of 0.0002% and specific weight of 8.9. (C23; Cu-a)

149-C.* **Vacuum Melting and Heat Treating. Pt. 1.** Roger Giler. *Industrial Heating,* v. 25, Mar. 1958, p. 480-482, 484, 486, 490, 492, 494, 626.

Vacuum is produced by mercury or oil diffusion pump or a combination of diffusion ejector pumps. Vacuum is measured by McLeod gage, electrical gages, or by electron emission. Various vacuum melting furnaces and newly adopted melting processes. (To be continued.) (C25, D8m, 1-55)

150-C.* **Semicontinuous Casting of Beryllium Copper.** K. G. Wikle. *Metal Progress,* v. 73, Apr. 1958, p. 85-89.

Billets in large and small size are cast with high yield of sound, fine-grained metal, free from residual beta phase, and at a lower cost per pound than by the conventional Durville process.
(C5q; Cu, Be, 4-52)

151-C.* **Zone Melting Opens New Horizons in Metallurgy.** *Metal Progress,* v. 73, Apr. 1958, p. 97-102.

Zone melting is fast developing into an important method for metal purification. It also has other uses in research, development and manufacturing. For example, it can distribute an impurity uniformly throughout a single crystal—a problem long unsolved. (C28k)

152-C.* **Electron Beam Purifies Alloys.** *Steel,* v. 142, Mar. 24, 1958, p. 108-109.

High melting point metals (Ge, Ti, Zr, Ta, Mb, Co) purified by electron beam melting under high vacuum.
(C28, 4-73; Ge, Ti, Zr, Ta, Mb, Co)

153-C. (German.) **Significance of Electrochemistry in the Production of Metals.** Gunther Hansel. *Bergakademie,* v. 9, Oct. 1957, p. 499-512.

31 ref. (C23, L17)

154-C. (German.) **Present State of Technical Aluminum Electrolysis and Future Trends in Development.** H. Ginsberg. *Metall,* v. 12, Mar. 1958, p. 173-175.

Furnaces for current strength up to 100,000 amp. and above are mostly used. Anodes were developed in single large blocks up to 2000 kg. Progress in development of rectifiers; decrease of current density below 0.6 amp. per sq. cm. is unfavorable; further increase of current strength is possible.
(C23; Al)

155-C.* (German.) **Present Day Continuous Casting of Aluminum.** E. Hermann. *Metall,* v. 12, Mar. 1958, p. 193-197.

Equipment for continuous casting. In Germany vertical casting is mostly used. Possible defects caused by remaining gases. Unified casting-rolling process.
(C5q, 1-52; Al)

156-C.* **Leaching of Manganese From Pyrolusite Ore by Pyrite.** G. Thomas and B. J. P. Whalley. *Canadian Journal of Chemical Engineering,* v. 36, Feb. 1958, p. 37-43.

By heating an aerated slurry of ore and pyrite and recycling the leach liquor at controlled acidity to attack fresh ore, a manganous sulphate solution free of iron was obtained which, when heated to about 175° C., yielded manganous sulphate monohydrate. During the leaching process, iron in the liquor was alternately oxidized by the pyrolusite and reduced by the pyrite. In an alternative leaching procedure, the heating of an aqueous slurry of pyrite in an autoclave first under oxygen pressure and then in the absence of oxygen produced an acidic ferrous sulphate solution suitable for the subsequent leaching of pyrolusite ore at ambient temperatures. 11 ref. (C19n; Mn)

157-C. **Dawn's Uranium Plant Features Acid Extraction and Column IX.** Don Hargrove. *Mining World,* v. 20, Feb. 1958, p. 34-41.

Process of split agitation, acid extrusion of uranium from the ore,

use of column ion exchange circuit. (C19; U)

158-C.* (Italian.) **Production of Electrolytic Cadmium From Zinc Smelter Byproducts by Means of Amalgam Metallurgy.** G. Binetti and A. Vaschetti. *Metallurgia Italiana,* v. 50, Jan.1958, p. 1-7.

Process giving 99.95% pure Cd consists of three stages: leaching of cadmiferous materials with sulphuric acid; treating of leaching liquor with Zn amalgam and recovery of a Cd amalgam; electrolysis in rotating disk cells, where Cd amalgam acts as an anode, with part of its Cd content going into solution and being deposited on cathode. 14 ref. (C29, C23p, A11c; Cd, Zn)

(C19n; Cf, U; RM-n)

160-C.* Arc Melting Molybdenum. George A. Timmons and Robert G. Yingling. Paper from "The Metal Molybdenum", American Society for Metals, p. 80-108.

Pressing - sintering - melting machine is capable of converting 1000 lb. of Mo powder to a cast ingot 9 in. diameter by approximately 45 in. long at the rate of 10 lb. per min. The charge is automatically compacted into a consumable electrode which is sintered by resistance heating to increase its strength and then arc melted in a water-cooled copper mold, all three operations occurring simultaneously and successively in a single vacuum system. (C5h, 1-73; Mo)

161-C.* Sintered and Arc-Melted Molybdenum Alloys. R. Kieffer and E. Pipitz. Paper from "The Metal Molybdenum", American Society for Metals, p. 530-552.

Competition between arc melting and sintering has reached an equal level, since the latter has advanced to the 100 to 300-kg. category. Sintered alloys are normally more formable than the more coarse-grained melted alloys. The latter may be rolled and swaged by using high operating temperatures (over 2900° F.) and grain-refining additives. 31 ref.

174-C. Mechanism of Formation of Zirconium Sponge in Zirconium Production by the Magnetothermic Process. F. G. Reshetnikov and E. N. Oblomeev. *Soviet Journal of Atomic Energy,* v. 2, no. 5, 1957, p. 561-564. (Translation by Consultants Bureau, Inc.)

Growth of the Zr sponge on the wall of the reaction crucible above the level of the molten bath is the result of the reaction of zirconium chloride vapor with molten Mg as the latter ascends by capillary action through the previously formed sponge. The amount of zirconium chloride reacting with Mg in unit time depends more upon the perimeter of the crucible than upon the surface area of the bath. It is recommended that partitions be placed in the crucible to act similarly to the crucible wall. 7 ref. (C26; Zr)

175-C. (English.) Contribution to the Utilization of Pyrites With Low Content of Gold in the Rumanian People's Republic. G. Vanci and Gabriela Maltezeanu. *Revue de Métallurgie (Bucarest),* v. 2, 1957, p. 113-128.

The Au from pyrites with low Au content (4 to 15 g. per ton Au) can be economically extracted by the cyanide process after previous roasting at 600-700° C. With greater Au content (15 to 40 g. per ton) a two-stage cyanide process can be economically utilized. 3 ref. (C19p; Au)

176-C.* Preparation of Plutonium-Aluminum Alloys. O. J. C. Runnalls. *Atomic Energy of Canada Ltd., Chalk River Project,* AECL no. 458, June 1957, 17 p.

Direct reduction of PuF_3 and PuO_2 with liquid Al. PuF_3 is reduced more rapidly at 900° C. than at 1100° C. with liquid Al, owing to the evolution of gaseous AlF, which is stable at the former temperature. Yield for this process averaged 95% in alloying 337 g. of Pu. Alloys for a second fuel rod were prepared by the Al reduction of a pressed PuO_2-cryolite mixture at 1100° C., with a Pu yield of 98%. 7 ref. (C26; Pu, *Al*)

177-C. Atomic-Age Metal Extraction. L. W. Coffer. *Chemical Engineering,* v. 65, Jan. 1957, p. 107-122.

Chemical engineering techniques, much ignored in metal production, now solve tough corrosion, erosion, high-temperature problems in a host of new processes for making "difficult" metals. 34 ref. (C-general)

178-C. Electrolysis of Ferrous Chloride Solutions With Special Reference to Extraction of Metals and Sulphur From Sulphide Ores. V. Arvamuthan. *India Section, Electrochemical Society, Bulletin,* v. 6, July 1957, p. 49-50, 62.

(C23n)

179-C. Plutonium Recycling With Molten UF_4. Archie G. Buyers. *Nucleonics,* v. 15, Nov. 1957, p. 100-103.

Plutonium transfer from spent to fresh uranium fuel by oxidation into molten UF_4 and reduction of the fluoride mixture to U-Pu alloy has been successfully accomplished. Scaled up, the process is calculated to yield 85% of the Pu. Final alloy should contain 15-35% of the rare earths and $<$ 10% of other fission products. Suggested applications are to the sodium graphite reactor and enriched-core fast-breeder fuel cycles. 5 ref. (C28j; Pu, U)

180-C. Method for the Separation of Plutonium From Uranium. E. Haeffner and A. Hultgren. *Nuclear Science and Engineer,* v. 3, May 1958, p. 471-481.

A chromatographic method with possibilities for use on a larger scale. 5 ref. (C28; Pu, U)

(C19s)

217-C.* Production of Hafnium. Pt. 2. H. P. Holmes, M. M. Barr and H. L. Gilbert. *Industrial Heating,* v. 25, June 1958, p. 1114-1126.

Commercial-grade zirconium tetrachloride is treated and purified to remove hafnium hydroxide which is dried and calcined to hafnium oxide. Direct chlorination of the hafnium oxide briquets is done in a vertical shaft, pilot-model chlorinator, with three graphite plates embedded in the lining serving as electrodes. Condenser is a cyclone type. (To be continued.)

234-C. Electrolytic Separation Studies of Nickel and Cobalt From Nicaro-

Plant Products. M. J. Ferrante, P. C. Good and P. M. Gruzensky. *U. S. Bureau of Mines, Report of Investigations 5394*, May 1958, 30 p.

Electrolytic process for recovering specification-grade Ni from either Nicaro (Cuba) pregnant liquor or basic carbonate precipitate currently in production. Nicaro products contain Ni and Co in the ratio of 64:1. 29 ref. (C23; Ni, Co)

235-C.* Sodium Reduction of Titanic Chloride. V. E. Homme, M. M. Wong and D. H. Baker, Jr. *U. S. Bureau of Mines. Report of Investigations 5398*, May 1958, 29 ref.

Reduction is performed in two steps: titanic chloride is reduced with molten sodium to titanous chloride and salt at a furnace temperature of 400 to 750° C. according to the reaction $2\ Na + TiCl_4 \rightarrow TiCl_2 + 2\ NaCl$. The lower valent Ti in this melt is then reduced to metallic Ti of high purity, at furnace temperatures of 800 to 850° C., by adding sodium to complete the requirements of the reaction $2\ Na + TiCl_2 \rightarrow Ti + 2\ NaCl$. (C1p; Ti)

236-C. Preparation of Metallic Plutonium on a Gram Scale. F. Anselin, P. Faugeras and E. Grison. *United Kingdom Atomic Energy Authority*, IGRL. T/W.63, 1958, 4 p. (From *Comptes Rendus des Sciences de L' Academie des Sciences*, v. 242, 1956, p. 1996-1998.)

Preparation of plutonium trifluoride and its conversion to Pu metal by thermal reduction with Ca. (C26; Pu, *Ca*)

237-C.* (French.) Industrial Scale Extraction and Purification of Samarium and Europium. C. de Rohden. *Energie Nucleaire*, v. 2, Jan-Mar. 1958, p. 21-28.

Description of two pieces of apparatus for continuous or semicontinuous preparation of about 1 kg. per day of oxide of samarium, and about 100 kg. per day of oxide of europium, both having purity of over 99%. Capacity of apparatus could be doubled if demand justified extraction on larger scale. (C-general, 1-52; Sm, Eu)

238-C.* Effect of Nitrogen and Vacuum Degassing on Properties of a Cast Aluminum-Silicon-Magnesium Alloy (Type 356). R. K. Owens, H. W. Antes and R. E. Edelman. *American Foundrymen's Society. Transactions*, v. 65, May 1957, p. 424-431.

The tensile properties of this alloy were insensitive to method of degassing. The effects of gas content and porosity on the ultimate and yield strength were determined for virgin and remelted heats. 11 ref. (C5m; 1-73, Al-b)

275-C.* Production of Discaloy by Vacuum Arc Melting. D. R. Carnahan. *Metal Progress,* v. 74, Aug. 1958, p. 100-102.

Discaloy is now being produced by the consumable-arc process. Problems solved during development of the commercial melting method.
(C5h, 1-73; SGA-h)

276-C. Vacuum Melting Today. *Metal Progress,* v. 74, Aug. 1958, p. 94-99.

Vacuum is being increasingly used in processing steels and superalloys for today's most stringent applications. Appreciable amounts of active elements can be added as alloying agents; gases and inclusions are reduced. The user has available a number of vacuum-produced alloys and more are in the offing.
(C25, C5, D8m, D9, 1-73)

277-C. On Vacuum Alloys. On Superheating of Alloys. D. S. Kamenetskaya. Paper from "Problems of Metallography and the Physics of Metals", *U.S. Atomic Energy Commission,* AEC-tr-2924, 1958, p. 39-41. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Substances can be melted in a vacuum which have a pressure at the triple point lower than the pressure corresponding to the given vacuum. Mg, Zn, Cd and Mn cannot be melted in a vacuum at a pressure equal to or lower than 10^{-2} mm. Hg. Al can not only be melted in a vacuum, but can be heated in a liquid state to considerable temperatures whereas Mg, Mn, Cd and other substances evaporate long before the melting temperature, corresponding to atmospheric pressure, is reached.

Removal of vanadium pentoxide, phosphorus pentoxide, sodium carbonate and caustic soda by leaching with lye. V_2O_5 and CaO are recovered. (C19n; Al)

286-C.* (Hungarian.) **Current Efficiency of Aluminum Reduction Plants.** Szakal Pal. *Kohaszati Lapok,* v. 91, Apr. 1958, p. 173-179.

Efficiency of modern furnaces is 85-90%. Each per cent improvement in efficiency increases the world product about 40,000 tons. Factors affecting efficiency are temperature, actual distance between the electrodes, current density, chemical composition of the electrolytes, physical and mechanical composition of the cathode and physical state of anode. 54 ref. (C23n; Al)

287-C.* (French.) **Uranium Manufacturing Cycles.** Michel Brodsky. *Energie Nucleaire,* v. 2, Apr-June 1958, p. 110-115.

Steps in typical process used in France. Aspects of British, Belgian and U. S. processes. (C-general; U)

288-C.* (Russian.) **Utilization of Low-Grade Manganese Ores for Production of Ferromanganese and Silicomanganese.** E. M. Alekseev. *Stal',* v. 18, July 1958, p. 617-620.

It is technically possible and economically expedient to produce ferromanganese and silicomanganese from carbonaceous and low-grade oxide manganese ores in electric furnaces. Reserves of carbonaceous ores are in many regions three times as high as oxide ores. (C21d; Mn, AD-n, Fe)

289-C. **Causes of Difficult Stripping of Cathode Zinc Deposits.** V. L. Klimenko. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 569-579. (Translation by Consultants Bureau, Inc.)

Difficult stripping in the industrial electrolysis of zinc sulphate solution refers to the abnormal increase of the force required to separate the cathodic Zn deposit from the Al cathodes owing to adhesion between them. (C23p; Zn)

290-C.* **Electrorefining of Titanium From Binary Alloys.** J. R. Nettle, T. E. Hill, Jr., and D. H. Baker, Jr. *U. S. Bureau of Mines, Report of Investigations 5410,* 1958, 11 p.

Seven alloys of Ti with 5% Mn, V, Al, Cr, Sn, Zr and Mo examined to determine efficiency of Ti separation under controlled conditions. (C23p; Ti)

291-C.* (German.) **Maximum Oxidation of Antimony in the Dry Lead Refining Process.** Joachim Barthel. *Freiberger Forschungshefte,* no. B28, June 15, 1957, p. 36-39.

Research results show that maximum oxidation of Sb in Pb is dependent upon high degree of oxidation of Sb_2O_3, which is a function of Sb content in metal phase, temperature and solubility. (C28j; Pb, Sb)

292-C.* (German.) **Cadmium Precipitation From Solutions Obtained From Leaching Zinc Ores.** Klaus Hein. *Freiberger Forschungshefte,* no. B28, June 15, 1957, p. 40-41.

During Cd ion oxidation-reduction process in Zn electrolytes in the presence of Cu, an accelerating and a retarding reaction occur. Accelerating effect is due to increased adsorption of Cd ions on activated Cu-Zn surface; retarding effect is caused by metals with low, irreversible hydrogen potential (Cu, Ag) which repress Cd precipitation due to increasing hydrogen evolution. Metals with high irrversible hydrogen potential (Sn, Hg, Cd) have a small retarding effect on speed of Cd reduction. Metals which either accelerate or retard Cd precipitation process can therefore be predicted. (C23; Cd, Zn)

293-C. (Polish.) **Mechanism of the Cathode Process in the Metallurgy of Aluminum.** Leszek Suskiy. *Wiadomosci Chemiczne,* v. 10, no. 3, 1956, p. 141-159.

Theoretical bases of electrolytic production of Al with special reference to the mechanism of the cathode process. It is not established definitely whether Al is extracted during an electrode reaction directly or the extraction is due to some secondary processes. (C23p; Al)

294-C.* Preparation of Titanium-Aluminum Alloys by Alumino-Thermic Reduction. Pt. 2. By Use of Energisers. R. A. Sharma, A. N. Kapoor and A. B. Chatterjea. *Indian Institute of Metals, Transactions,* v. 11, June 1958, p. 89-99.

Energizers such as barium peroxide or potassium chlorate were utilized to produce higher temperatures and to increase the Ti content in the alloy. Amount of energizer necessary to obtain suitable temperature (2200° C.) was calculated. Variation of aluminum and barium peroxide additions, and admixture of various amounts of calcium oxide and of the particle size of the Al and rutile were studied to ascertain the optimum conditions for the reduction of rutile. 6 ref. (C26; Ti, *Al*)

295-C.* Studies on Vanadium and Titanium Bearing Iron Ore of Mayurbhanj. R. K. Mitra and G. P. Chatterjee. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 111-121.

Mineral described contains about 60% Fe, 13.6% TiO_2; 2.3% SiO_2 and other insolubles; 1.26% V_2O_5 and traces of P and S. Magnetic separation at different grades was resorted to followed by mineralogical examination of the fraction thus obtained. Reduction treatments of the ore in the solid state by coal gas and also by finely powdered charcoal at 950 and 1050° C. were studied. Reduction by gas at 1050° C. was found most suitable. (C26, B14j; Fe, *V, Ti*)

296-C.* Preparation and Electrolysis of Titanium Trichloride. H. N. Sinha and H. K. Worner. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 123-133.

Titanium trichloride can be electrolyzed in suitable molten salt mixtures to produce Ti. Method for preparing trichloride by reducing tetrachloride with hydrogen on a hot silica surface. The trichloride thus produced has been dissolved in a carrier electrolyte consisting of a eutectic of LiCl/KCl and electrolyzed at 550° C. to yield metal powder of purity and ductility comparing favorably with Kroll sponge. 24 ref. (C23p, H10b; Ti)

297-C.* Production of Some Less Common Metals by Fused Salt Electrolysis. R. K. Mangal and H. N. Sinha. *Indian Institute of Metals, Transactions,* v. 11, June 1958, p. 101-107.

Fused salt electrolysis offers good opportunities for the production of Be, Th, U and Zr. Problems include: proper cell design because most of the baths have to be electrolyzed in an inert atmosphere; techniques of consolidating the metal crystals on the cathode; necessity of finding suitable refractory materials for the construction of the cell. 25 ref. (C23p; Be, Th, U, Zr)

298-C.* Electrolytic Recovery of Antimony From Battery Wastes. B. B. Dey, V. Aravamuthan and P. R. Rajagopalan. *Journal of Scientific and Industrial Research,* v. 17A, June 1958, p. 240-242.

The Pb-Sb alloy obtained by melting battery wastes is first subjected to electrorefining in a fluoborate bath to yield anode mud containing 85-90% Sb and 10-15% Pb. Electrolysis is carried out using Monel metal cathodes and graphite as anode. Deposits are bright, adherent and of high purity. (C23p, A11d; Sb, Pb)

299-C. (Russian.) **Reasons for Formation of Zinc Sponge Upon Cathodes of Zinc-Containing Electrolytes at Currents of Low Densities.** N. T. Kudryavtsev, R. Yu. Bek and I. F. Kushevich. *Trudy Moskovskogo Khimiko-Tekhnologicheskogo Instituta,* v. 22, 1956, p. 137-142.

Mechanism of Zn-sponge formation on a cathode, at low current densities, in Zn-containing electrolytes and, in particular, the part played by anodes and ions of nobler metals and oxidizing agents. When electrolysis is carried on with insoluble anodes (Pt and Ni) the sponge is formed only at the upper part of cathode near the boundary of the electrolyte with air; when electrolysis is carried on with Zn anode the sponge is formed over the whole surface. (C23; Zn)

300-C. (Russian.) **Electrolysis of Melted Manganese Slag.** O. A. Yesin, G. A. Toporishchev and P. M. Shurygin. *Izvestiia Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 5, 1957, p. 85-91.

Electrolysis of melts of $MnO-SiO_2$, $MnO-CaO-SiO_2$ and $MnO-Fe-Si_2$ were studied in a magnesite cell with a cathode of Ag or Fe-Mn alloy and a graphite anode at 1250 to 1500° C. Faraday's law is valid for both electrodes at the optimum parame-

ters of the process. (C23; Mn, RM-q)

301-C. A New Approach to the Synthesis of Metallic Hydrides. S. Ramamurthy. *Indian Institute of Metals, Transactions,* v. 11, June 1958, p. 81-88.

Gravimetric, vacuum dissociation and metallographic data indicate that a complex titanium-aluminum hydride ($TiH_2.3AlH_3$) is formed when a Sn-Al-Ti alloy powder is treated in hydrogen. 5 ref. (C19; Ti, Al, Sn)

302-C. Electron Beam Melting. *Metal Industry,* v. 93, Aug. 29, 1958, p. 176.

Heat for melting is supplied by an electron gun which serves as the cathode and bombards the melt stock (the anode) with electrons, heating it to the melting point. Molten metal drops into a water-cooled Cu crucible below. Ta, Mo and other metals have been produced of higher purity than ever known before. (C5; Ti, Ta, Zr, Mo)

303-C. A Rationale for the Recovery of Irradiated Uranium and Thorium by Solvent Extraction. T. H. Siddall. *Second United Nations International Conference on the Peaceful Uses of Atomic Energy.* A/CONF.15/P/521 U. S. A., June 1958, 24 p.
4 ref. (C19n; U, Th, 14-70)

304-C.* Production of Thorium Compounds. J. J. Barghusen and M. Smutz. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 54-69.

Principal methods for the recovery of Th from monazite, including the Ames monazite, the Battelle and the Brazilian processes. Alternative methods outlined are separation by precipitation, liquid-liquid extraction, ion-exchange, and electrolysis. 23 ref. (C-general; Th)

305-C.* Preparation of Thorium Oxide and Thorium Fluoride From Thorium Nitrate. Ray W. Fisher. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 70-77.

Operating technique used in the digestion of thorium nitrate and the precipitation and filtration of thorium oxalate; calcination of thorium oxalate; hydrofluorination of thorium oxide. (C19; Th)

306-C.* Development of the Thorium Tetra-Fluoride-Calcium Process for Thorium Metal. H. A. Wilhelm. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 78-103.

Main reactants are thorium tetrafluoride and calcium, and the charge contains an additive which brings about the formation and separation of the metal in massive form as the product of the reduction step. A subsequent melting and casting operation is employed to obtain Th ingots for fabrication into useful shapes. (C1p; Th)

307-C.* Consumable-Electrode Arc Melting of Thorium. A. H. Roberson and Robert A. Beall. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 114-123.

Consumable-electrode cold mold arc melting is an efficient method for preparing sound, homogeneous ingots for extrusion or forging from Ti sponge or electrolytic powder. Electrodes may be formed by cutting sponge into suitable shapes and welding them into suitable sizes, or by pressing the sponge into briquets that later are joined by welding. Th powder compresses into electrodes which usually require vacuum sintering to remove adsorbed gases. (C5h; Th)

308-C.* Direct Smelting of the Rich Sulfide Ore of Lead With Pyrite Cinder and Coke. Pt. 1. Tatsuo Matsukawa and Seiji Tokumoto. *Osaka University, Technology Reports,* v. 7, Oct. 1957, p. 399-402.

Lead sulphide ores smelted with pyrite cinder, coke and lime in muffle furnace. The sponge iron produced by the reduction acts as a desulphurizing agent. Yield of Pb is about 77%. 4 ref. (C21; Pb)

309-C. Principles Underlying New Highly Productive Methods of "Complex" Chemical Treatment of Polymetallic Iron Ores. D. P. Bogatsky and G. G. Urazov. *Academy of Sciences of the USSR, Bulletin,* no. 8, 1957, p. 933-941.

Simple and effective methods proposed for chemical refinement and treatment based on theoretical scheme of reduction-oxidation-reduction. 11 ref. (C19; Fe)

310-C. Avonmouth Zinc Blast Furnace Demonstrates Its Versatility. S. W. K. Morgan and S. E. Woods. *Engineering and Mining Journal,* v. 159, Sept. 1958, p. 95-99.
(C21a; Zn)

311-C. Liquid-Liquid Extraction of Uranium From Aqueous Solutions. E. H. Crabtree and C. J. Lewis. *Engineering and Mining Journal,* v. 159, Sept. 1958, p. 102-108.
(C19s; U)

312-C. Preparation of Iodide Thorium. N. D. Veigel, E. M. Sherwood and I. E. Campbell. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 104-113.

The relatively low as-deposited strength of iodide thorium places a limitation on the size of the crystal bars that can be produced. Large-diameter starting filaments will be required for production of large-diameter crystal bar unless conditions can be established for the formation of more coherent deposits. (C1p; Th)

313-C. Electrolytic Refining of Thorium. Robert A. Noland. Paper from "The Metal Thorium", American Society for Metals, 1958, p. 124-132.

Purified product was deposited as a mass of discrete crystals on a Mo cathode. (C23; Th)

314-C.* Separation of Niobium and Tantalum by Liquid Extraction. Ernest L. Koerner, Jr., Morton Smutz and Harley A. Wilhelm. *Chemical Engineering Progress,* v. 54, Sept. 1958, p. 63-70.

Acid dissolution of columbite, leaching with hexone, separation of Cb and Ta with hexone, oxide conversion and solvent recovery of oxides. 9 ref. (C19; Cb, Ta)

315-C.* (French.) **Dissolution of Uranium From French Ores by Oxidizing Attack.** A. Graire. *Energie Nucleaire,* v. 2, Apr-June 1958, p. 116-119.

Dissolution of U from pitchblende ores is generally accomplished by oxidizing sulphuric attack, oxidizing agent containing either pyrolusite, ferric sulphate, nitrates or chlorates. In all cases, ferric sulphate appears to be intermediate compound of the solubilization reaction. Previously used methods of leaching ash appear to be directly applicable today in U recovery. For U as well as for Cu, duration of leach, temperature of solution, concentration in Fe^{+++} are principal factors determining reactions of dissolution. (C28j; U)

316-C.* (French.) **Manufacture of Aluminum Conductor Wire by the Properzi Process at the St. Jean-de-Maurienne Plant of the Pechiney Co.** Andre Crevot and J. C. Beguin. *Revue de l'Aluminium,* July-Aug. 1958, p. 751-756.

Properzi machine produces wire rod directy from molten Al. Metal is poured into triangular throat of casting wheel and rough rod obtained moves continuously through a 13-stand rolling mill. Wire is wound in 2250-lb. coils by specially designed double coiler, reducing butt welding requirements before wire-drawing operations. Improvements in metallurgical control and process conditions at this installation have eliminated need for heat treatment of coiled rod, and in case of rod made of "Almelec", cracks formerly developed during solidification of rough stock and subsequent rolling no longer appear. (C5q, 1-52, F28; Al)

317-C.* (French.) **Process for Purification of Solutions of Plutonium Nitrate and Preparation of Metallic Plutonium.** S. Chambers and T. G. Hughes. *Energie Nucleaire,* v. 2, July-Sept. 1958, p. 202-206.

Plutonium nitrate solution, separated by extraction with dibutyglycol from solution obtained by dissolution of uranium bars, is concentrated by evaporation and purified by extraction with a mixture of tributyl phosphate and kerosene. Residual impurities from reagents and apparatus can be eliminated by a second purification in glass equipment. Nitrate solution is concentrated: nitrate is transformed into an oxide, then a fluoride, and finally into metal by reduction by calcium or magnesium. Impurities, which represent less than 1% by weight, are composed of Fe, Ni, Cr and U. 4 ref. (C-general; Pu)

318-C. Separation of Tantalum-Columbium by Solvent Extraction. K. B. Higbie and J. R. Wearing. *U. S. Bureau of Mines,* July 1956, 53 p.
(C19, Cb, Ta)

319-C.* (Rumanian.) **Extraction of Nickel From Minerals of the RPR by the Hydrometallurgical Method. Ammoniacal Process.** Al. Lupu and Ana Boiangiu. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 75-105.

Survey of work done from 1952 to 1954 for exploiting serpentines. Use of the ammoniacal process which is generally applicable to basic gangue minerals. Influence of degree of crushing, temperature and duration of roasting, addition of substances favoring reduction and degree of Ni

extraction, concentration of the washing solution, relation between solution and the material subjected to washing, duration of washing process. Variations of the process for extraction of magnesium oxide. 11 ref. (C19; Ni)

320-C.* (Rumanian.) **Contributions to the Problem of Continuous Cyanidation of Auriferous Minerals.** R. Badescu and Gh. Vanci. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 173-195.

From mathematical analysis of the process of continuous cyanidation, the following conclusions can be drawn: (1) The quantities of insufficiently cyanided mineral are smaller for installations incuding a higher number of reservoirs with smaller partial volumes. (2) Exceeding a certain output limit leads to insufficiently cyanided quantities of mineral, which are higher for installations with reservoirs of smaller dimensions. (C19p; Au)

321-C.* (Slovenian.) **Utilization of Nickel-Bearing Serpentines and Silicate-Oxide Ores in Nickel Production.** Krsto Cazafura, Joze Zakrajsek and Janex Wohinz. *Rudarsko Metalurski Zbornik,* no. 2, Summer 1958, p. 147-168.

Experiments with ores of 0.18 to 1.40% NiO, 0.0001 to 0.099% CoO, 6.68 to 57.35% Fe_2O_3, 0.80 to 5.54% FeO, 0.12 to 0.37% MnO, 1.33 to 3.35% Cr_2O_3, 2.27 to 2.30% Al_2O_3, 0.52 to 3.50% CaO, 5.98 to 38.13% MgO, 0.16 to 1.15% Na_2O, 0.20 to 0.47% K_2O, 17.78 to 49.53% SiO_2, 0.30 to 0.65% S, 0.14% SO_2, 0.33% P_2O_5, 0.002 to 0.006% As_2O_3, 0.20 to 1.64% CO_2, concerning the possibility of concentration by mechanical, hydromechanical and magnetic separation showed negative results. (C-general; Ni)

322-C. **Chemicals in Ore Processing—a Fifty-Year Review.** Raymond E. Byler. *Industrial and Engineering Chemistry,* v. 50, Sept. 1958, pt. 1, p. 50A-53A.

Hydrometallurgy, leaching, flotation. (C19, B14h)

323-C. **Separation of Uranium and Thorium.** S. V. Suryanarayana and B. H. S. V. Raghava Rao. *Scientific and Industrial Research Journal,* v. 17B, Aug. 1958, p. 310-312.

Simple and direct ion-exchange method suggested. Both elements are absorbed by the resin (Amberlite IR) from which U can be eluted first with 1.70*N* hydrochloric acid. 6 ref. (C19s; Th, U)

324-C. **Some Experiments on the Fused Salt Processing of Liquid Metal Fuels.** J. K. Higgins. *United Kingdom Atomic Energy Authority, AERE M/M 194,* 1958, 7 p.

Reaction between a fused sodium, potassium, magnesium chloride eutectic and a liquid bismuth solution containing small amounts of cerium (100 ppm. by wt.) and uranium (1000 ppm. by wt.). Experimental results for the transfer of Ce and U from the metal to the salt phase in a silica container. It is concluded that contamination from this container presents serious difficulties to an electrolytic method for the processing of liquid metal fuels. 15 ref. (C23p, T11g, U, Bi, Ce)

325-C. **Precipitation of Thorium as Thorium Hydride From Thorium-Magnesium Solutions.** Paul F. Woerner and P. Chiotti. Ames Laboratory, Iowa State College. *U. S. Atomic Energy Commission, ISC-928,* Aug. 1957, 42 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

The extent to which thorium can be precipitated from the Th-Mg solutions as the dihydride was determined by reacting purified hydrogen gas at 1 atm. pressure with the liquid metal solutions. 14 ref. (C27; Th, Mg)

326-C. **Methods and Operations at the Yerington Copper Mine and Plant of the Anaconda Co., Weed Heights, Nev.** M. Clair Smith. *U. S. Bureau of Mines, Information Circular 7848,* 1958, 37 p.

The exploration, development, equipment and mining of a large, oxidized-copper ore deposit by open-pit methods, the leaching of the ore with sulphuric acid solution and recovery of the Cu as cement copper. 6 ref. (C19n; Cu)

327-C. **Remelting of Steel and Alloys in Vacuum Arc Furnace.** G. N. Okorokov, A. Yu. Polyakov and A. M. Samarin. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 5, May 1958, p. 59-62. (Henry Brutcher, Altadena, Calif., Translation no. 4339.)

Experiments on the removal of gases and nonmetallic inclusions from steels and alloys by remelting in a vacuum arc furnace. (C25, D8m, W18s, 1-73; ST)

328-C.* (French.) **Use of Copper as a Cation Exchanger in the Separation**

of Rare Earths by Ion Exchange With the Help of Ethylene-Diamino-Tetraacetic Acid. J. Loriers and C. Lenior. *Comptes Rendus,* v. 247, July 28, 1958, p. 468-471.

Improvements are that rare earths in complex solution with EDTA acid can be selectively fixed on a resin saturated with Cu^{2+} ions; efficient separation is obtained with EDTA acid by means of a ring of Cu^{2+} cations in columns; Cu salt solutions of EDTA acid can be used as eluents. 6 ref. (C19s; EG-g, *Cu*)

329-C.* A Review of the Extractive Metallurgy of Niobium. M. E. Sibert, A. J. Kolk, Jr., and M. A. Steinberg. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 20-34.

Chemical reduction of oxides and halides such as Cb_2O_5, K_2CbOF_5, K_2CbF_7 and $CbCl_5$ has been conducted with varying degrees of success. Aqueous electrochemical reduction has not yet yielded a metallic deposit. The electrolysis of molten baths containing K_2CbOF_5 or K_2CbF_7 has produced Cb metal. The more promising methods of preparation of Cb metal at the present include reaction of Cb_2O_5 with C, the H_2 and active-metal reduction of $CbCl_5$, and electrolysis of K_2CbF_7-NaCl melts. 71 ref. (C19, C23p; Cb)

330-C.* Recent Developments in Separating Tantalum and Niobium by Solvent Extraction. Joan L. Tews and Sherman L. May. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 36-43.

Application of the solvent extraction system, hydrofluoric acid-sulphuric acid-methyl isobutyl ketone, will yield more than 90% of the contained Ta and Cb values free of each other and free of other metallic impurities irrespective of the Ta-to-Cb ratio in the starting material. 7 ref. (C19; Ta, Cb)

331-C.* Investigation of Electrolytic Processes for Preparation of High Purity Niobium Metal. A. J. Kolk, M. E. Sibert and M. A. Steinberg. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 44-53.

Direct electrolysis of molten K_2CbF_7-alkali halide mixtures using an inert graphite anode. High-purity, cold ductile metal has been produced by this type of electrolysis under a variety of experimental conditions. A second process is the electrorefining of an impure Cb, prepared by a high-vacuum high-temperature reaction of the pentoxide (Cb_2O_5) with carbon. Difficulty has been experienced with respect to hydrogen being carried over to the cathode deposit. (C23p; Cb-a)

332-C.* The Removal of Gaseous Impurities by Vacuum Arc Melting. Stanley J. Noesen. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 150-156.

Pressure of noncondensable gases in consumable electrode arc melting measured by utilizing hollow Mo electrode. A pressure differential of 3000 microns was maintained between arc zone and furnace body with a gas evolution of 1200 microliter per sec. with the ratio of cross-sectional areas of electrode to crucible being 0.17. Mo alloy with 0.5% Ti was sintered and arc melted to determine degree of purification obtainable in this equipment. Oxygen was reduced from 780 ppm. to 4 ppm.; nitrogen from 190 to 6 ppm.; hydrogen from 130 to 0.5 ppm. and carbon from 420 to 120 ppm. (C25; Mo-b)

333-C.* What Vacuum Melting Process Shall I Use? A. M. Aksoy. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 168-176.

Basic principles, advantages and limitations of vacuum induction melting, vacuum arc melting and vacuum degassing processes. Vacuum induction melting used for production of high-quality products relatively small in size and where compositions must be closely controlled. Vacuum arc remelting suitable for large forging and quality products of less critical nature. Vacuum degassing primarily used to reduce hydrogen content of steel. 17 ref. (C25, D8m)

334-C.* (Japanese.) Extraction of Uranium Metal. S. Tarara. *Metals,* v. 28, Oct. 1958, p. 763-766.

U is separated by thermal dissociation, reduction of oxides and halide, and fusion electrolysis. The first method can produce high-purity U but is not suitable for mass production. The last method is applicable for UCl_4, UF_4 and KUF_5; mass production is possible but

washing, desiccation, preservation and dissolution are not easy. The second method is applicable for UCl_4 and UF_4, but UCl_4 is not treated easily. Reduction of UF_4 by Ca or Mg is the most familiar method and can produce high-purity U at high efficiency. (C-general; U)

335-C. SX Line Wins Uranium From Variety of Ores. C. H. Chilton. *Chemical Engineering,* v. 65, Aug. 25, 1958, p. 104-107.

Solvent extraction plus modified ore-sampling and preparation yield uranium process dividends for Vitro Uranium Co. (C19; U)

336-C. Timken Goes to Vacuum Melting. *Iron Age,* v. 182, Oct. 23, 1958, p. 64-65.

Use of a consumable electrode vacuum arc furnace.

344-C.* Production of Ductile Niobium. O. P. Kolchin, N. V. Sumarokova and N. P. Chuveleva. *Soviet Journal of Atomic Energy,* v. 3, no. 12, 1957, p. 1397-1406. (Translation by Consultants Bureau, Inc.)

Production of powder containing 98.9 to 99.2% Cb by reduction of potassium fluocolumbate (K_2CbF_7) with sodium and production of ductile Cb by sintering in vacuo small bars pressed from this powder. Methods of producing ductile Cb by the carbothermic process. 20 ref. (C26, H10c; Cb)

345-C. Electrorefining of Vanadium, Chromium, Zirconium and Hafnium. D. D. Blue and D. H. Baker. Second United Nations Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/698, 1958, 17 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Electrorefining technique consists of transfer of treated metal from an anodic electrode via a molten-salt electrolyte to the cathode, where the product is deposited as a solid. Design of equipment, properties of the electrolyte, operating variables are major factors controlling transfer characteristics and product quality. (C23p; V, Cr, Zr, Hf)

346-C. A Continuous Electrolytic Process for the Preparation of Beryllium Metal. R. B. Holden, M. C. Kells and C. I. Whitman. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/717, 1958, 7 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Preparation of an amalgam of Be by electrolyzing a NaCl-$BeCl_2$ fused salt mixture into a mercury cathode. Be in amalgam form is suitable for direct hot compaction to produce dense Hg-free Be. (C23p; Be)

347-C. Melting and Fabrication of Zircaloy. E. L. Richards, J. H. Hart, W. H. Friske and W. J. Hurford. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1010, 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Double, consumable electrode, arc melting process. Fabrication has been accomplished by almost all of the known metalworking processes. Wire of all gages has been produced by drawing a rod formed by hot rolling or extrusion; cups have been spun, deep drawn, flow turned, back extruded and impact extruded. Shapes have also been cast using a special vacuum melting and casting technique. 6 ref. (C5h; F-general, G-general; Zr-b)

348-C.* (German.) **Manufacture of High-Purity Nickel.** Konrad Georgi and Eberhard Merkel. *Neue Hütte,* v. 3, Sept. 1958, p. 553-561.

Experiments on the precipitation of metallic impurities in the electrolytic refining of Ni using hydrogen sulphide and freshly prepared, fine-powdered iron sulphide. The latter substance gave best results, precipitating Pb, Sn, Bi, Cd and Cu at the same time. 19 ref. (C27, C23p; Ni-a)

349-C.* (German.) **Electrolysis of Titanium Chloride in Melted Salt Mixtures.** Shinzo Okada, Makoto Kawane and Tomoyasu Hashino. *Zeitschrift für Electrochemie,* v. 62, no. 4, 1958, p. 437-441.

Experiments with titanium chloride in mixtures of LiCl-KCl and NaCl-KCl. The polarogram of TiCl ($2.3\text{-}10^{-4}$ mol. % of the mixture, at 400° C.) shows two upturns, the first reaches at approximately −0.9 volts E_k a summit of approximately 3.5 microns A, then the curve declines and starts to rise again at approximately −1.1 volts E_k. The $TiCl_4$ polarogram rises more uniformly. Anodic polarogram for $TiCl_3$ illustrated. 13 ref. (C23p, C1p; Ti)

350-C. Extraction of Plutonium From Neutron-Irradiated Uranium by Uranium Trichloride and Magnesium Chloride. D. E. McKenzie, W. L. Elsdon and J. W. Fletcher. *Canadian Journal of Chemistry,* v. 36, Sept. 1958, p. 1233-1240.

11 ref. (C6; Pu, U)

352-C. Transistor-Grade Silicon. Pt. 2. Zone Purification of Silicon Tetraiodide. G. H. Moates and B. Rubin. *Electrochemical Society,* Abstract no. 66, May 1957, p. 142-143. (C28k; Si)

353-C. Contribution to the Floating Zone Technique for Refining Silicon. E. Buehler. *Electrochemical Society,* Abstract no. 68, May 1957, p. 144-151.

Two operations, recrystallization and boron removal, are carried on simultaneously in the automatic floating zone refiner. (C28k; Si, *B*)

354-C. An Ion Exchange Approach to Molybdic Oxide. Howard Cox and A. K. Schellinger. *Engineering and Mining Journal,* v. 159, Oct. 1958.

Low-grade molybdenite ore processed to recover over 90% of Mo as either MoO_3 or $CaMoO_4$ in laboratory experiments. (C19s; RM-n, Mo)

355-C. Uranium Adsorption From Leach Slurries. Paul Noble, Jr., W. I. Watson, I. M. Whittemore, R. A. Carlson, J. C. Huggins and L. A. McClaine. *Industrial and Engineering Chemistry,* v. 50, Oct. 1958, p. 1513-1516.

(C19n; U)

356-C. An Arc Furnace for Zone Refining Metals. G. A. Geach and F. O. Jones. *Metallurgia,* v. 58, Oct. 1958, p. 209-210.

Use of furnace in which metal to be melted is held in a water-cooled Cu hearth while heated by an arc from an inert electrode overcomes difficulty of contamination from the containing vessel in zone refining the more refractory or reactive metals. (C28k, X24f)

357-C. Studies of Electrolytic Refining of Zinc. Pt. 4. Process of Inclusion of Lead in Cathode Zinc. Motoo Watanabe and Seitaro Fukushima. *Tohoku University, Science Reports of the Research Institutes,* v. 10A, no. 2, 1958, p. 120-132.

A comparison was made with the Pb content of Zn deposited on two cathodes in the same cell, of which one was enclosed in an unglazed cylindrical alumina diaphragm and the other was directly immersed in an electrolyte suspending a reasonable amount of lead peroxide particles. An electrolyte solution was forcibly circulated through the diaphragm to prevent growth of difference between the solution constituents, especially the Pb ion concentration, of both sides of the diaphragm. Distribution of the Pb between the ionic Pb deposition and the occlusion of lead Pb peroxide particle was determined by comparing the results from these two cathodes. (C23n; Pb, Zn)

358-C. Periodic Reduction in Particle Size of Aluminum Hydroxide During the Process of Decomposition of Aluminate Solutions. S. I. Kuznetsov. *Tsvetnye Metally,* v. 29, no. 9, 1956, p. 62-67. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ATS-20K20R.)

(C23; Al)

359-C. Entrainment Studies on Solvent Extraction of Uranium From Heavy Slurries. D. A. Ellis, R. S. Long and J. B. Byrne. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/497, 1958, 7 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Application of solvent extraction to slurry systems. Although presence of solids does not hinder extraction of U, losses of extractant by entrainment in the aqueous effluent are increased considerably. Amount of entrainment can be reduced by proper design of mixing equipment, dilution of effluent with water or addition of surface-active agents. 4 ref. (C19a; U)

360-C. Solvent Extraction for Recovering Uranium and Vanadium From Salt-Roast-Process Solutions. J. B. Rosenbaum, S. R. Borrowman and J. B. Clemmer. Second United Nations Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/501, 1958, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

U and V can be recovered from acid-leach solutions of salt-roast calcines by using a combination extractant composed of an aliphatic amine and an alkyl phosphate in a solution of kerosine containing tributyl phosphate. (C19a; Th, U)

361-C. Solvent Extraction Processing of Uranium and Thorium Ores. K. B. Brown, C. F. Coleman, D. J. Crouse, C. A. Blake and A. D. Ryon. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/509, 1958, 39 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Selected reagents and processes most representative of current U. S. process and development activities. Process flowsheets; pertinent chemistry, reagent costs, equipment, extent of commercial application. 59 ref. (C19a; U, Th)

362-C. Concentration and Purification of Uranium, Plutonium, and Neptunium by Ion Exchange in Nuclearly Safe Equipment. F. W. Tobe. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/520, 1958, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Nuclear safety is obtained by using resin beds with small diameters, or by using a composite column that consists of a series of shallow beds separated sufficiently to avoid interaction of the neutrons from the individually safe beds.
(C19s, A8c; U, Pu, Np)

363-C. A Rationale for the Recovery of Irradiated Uranium and Thorium by Solvent Extraction. T. H. Siddall. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/521, 1958, 24 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Technology and theory of the processing of irradiated nuclear fuels. Details of extractants. (C19a, T11g; U, Th, 14-70)

364-C. Developments in Melt Refining of Reactor Fuels. L. Burris, N. R. Chellew, S. Lawroski, G. A. Bennett, A. A. Chilenskas, M. Ader, H. M. Feder, J. B. Knighton, I. O. Winsch, J. Wolkoff and W. A. Rodger. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/538, 1958, 12 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Process consists simply of melting the fuel in an oxide crucible and holding it molten for a period of several hours. During this time purification from fission products is primarily effected by vaporization of the noble gases and other volatile elements such as cesium; and selective oxidation of the highly electropositive elements such as the rare earths followed by their removal in a surface skin or reaction layer which forms along the crucible walls. 11 ref. (C28; U)

365-C. Production of Boron-10. G. T. Miller, R. J. Kralik, E. A. Belmore and J. S. Drury. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1836, 1958, 30 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Enrichment of the B-10 isotope by the fractionation of the boron trifluoride-dimethyl ether complex; reduction of the enriched complex to elemental B. 15 ref. (C6c; B)

366-C.* (Book.) Zone Melting. William G. Pfann. 236 p. 1958. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16, N. Y. $7.50.

Comprehensive coverage of theory and practice includes information on distribution coefficient, theory of zone refining, calculation of distribution, zone refining techniques, application to semiconductors, metals and chemicals. Continuous zone refining methods; zone leveling, zone perturbation techniques and temperature-gradient zone melting. Set of computing zone refining curves showing impurity concentrations throughout ingot as a function of the number of passes. (C28k)

367-C. Zone Melting and Crystal Pulling Experiments with AlSb. W. P. Allred, Bernard Paris and M. Genser. *Electrochemical Society, Journal,* v. 105, Feb. 1958, p. 93-96.

High resistivity ingots result from zone refining in Al_2O_3 crucibles. 4 ref. (C28k, P15; Al, *Sb,* 14-68)

368-C. Flash Melting Copper Concentrates. Petri Boyk, John Ryselin, Jorma Honkasalo and Rolf Malmstrom. *Journal of Metals,* v. 10, June 1958, p. 395-400.

Technique whereby the concentrate, with or without additional fuel, is suspended in gases containing O, so that the heat of oxidation reactions bring the suspended particles to a smelting temperature. From the suspended state the hot particles are separated and molten slag and matte are deposited on the furnace hearth. 12 ref. (C5k; Cu)

30-D. **Liquid Fuel Additives. Uses in Steelmaking.** J. Firminger. *Iron and Steel,* v. 30, Dec. 1957, p. 642-644.

Chemical and physical properties of liquid fuels; a benefit derived from the use of additives. Applications of liquid fuel include openhearth furnaces, soaking pits, reheating furnaces and mill furnaces. (D general, F21b; RM-k)

31-D.* **Economic Future of the Large Electric Arc Furnace.** W. B. Wallis. *Iron and Steel Engineer,* v. 34, Dec. 1957, p. 110-113.

Future of the electric furnace will become unlimited as soon as it is divorced from 100% scrap charge; possible alternates are use of hot metal, use of hydrogen-reduced ores and desiliconized hot metal; production of electric furnace pig iron at lower than present power rates provides another alternative. (D5, 17-53; ST)

32-D. **New Trends in Firing Practices for Open Hearths.** James E. Goodin. *Iron and Steel Engineer,* v. 34, Dec. 1957, p. 158-159.

Experimental program at Granite City Steel Co. using high-pressure natural gas to replace steam as the atomizing agent in the furnaces. (D2; ST, RM-m)

33-D. **Expansion Program at Great Lakes Steel Corp. Nears Completion.** *Iron and Steel Engineer,* v. 34, Dec. 1957, p. 180-183, 186.

(D general, W10; ST)

34-D.* **Study of the Tuyere Combustion Zone.** J. Taylor, G. Lonie and R. Hay. *Iron and Steel Institute, Journal,* v. 187, Dec. 1957, p. 330-341.

The tuyere combustion zone has been explored on an experimental furnace by raceway measurements and gas-composition surveys. Effects of variables such as air velocity and temperature, tuyere diameter, and coke size. Concluded that raceway measurements, which are easy to make, are a reliable guide to the extent of the combustion zone. 8 ref. (D1b; Fe)

50-D. On the Reduction of Hematite by Solid Carbon. K. Shimanaka. *Tetsu to Hagane,* v. 43, no. 9, 1957, p. 1017. (Henry Brutcher Translation no. 4064, Altadena, Calif.)

(D8; Fe)

51-D.* Lime Powder Desulphurization Proves Practical, Efficient. *Iron Age,* v. 180, Oct. 31, 1957, p. 66-67.

Process consists of blowing a suspension of powdered lime either in air or nitrogen through bottom of special ladle and into liquid pig iron. For 12 tons of pig iron, duration of blow was 5 min. with lime concentration of nitrogen of about 0.5 lb. per cu. ft. and flow of about 120 cu. ft. per min. Method reduces

sulphur content to below 0.010%. (D9s, D11h; CI-a)

52-D. New U. S. Developments in Direct Reduction. A. Hegarty. *Iron and Steel,* v. 30, Oct. 1957, p. 483-485.

Current efforts in the U. S. in the direct reduction of iron ore including H-iron process, Esso-Little reduction process and U. S. Steel fluidized bed reduction system. (D8j)

53-D.* Influence of Slag on Iron Composition. A. J. Burgess and B. G. Baldwin. *Iron and Steel,* v. 30, Oct. 9, 1957, p. 510-514.

Three-week trial carried out at blast furnace to investigate relation between metal composition and slag properties. Data collected on composition and temperatures of slag and metal at every cast during trial period. Normal practice was followed during first week; in second week slag basicity altered by reducing limestone charge; in third week basicity and sulphur level in iron were returned to normal. Discusses sulphur balance of in-going and outgoing materials, liquidous properties of blast furnace slags, differences in manganese and sulphur contents of roughing and flushing slags and carbon and silicon content in relation to furnace operation and slag contents. (D11n, D1; CI-a, RM-q)

54-D.* Proposal for a Self-Lining Blast Furnace. W. A. Archibald, T. P. Brown and L. A. Leonard. *Iron and Steel,* v. 30, Oct. 9, 1957, p. 515-521.

Nature of the burden and the refractory, movement of materials in blast furnace, forces acting on refractory walls, phase changes and causes of lining failure. Proposals for self-lining blast furnace using refractory nature of burden held in static layer along furnace walls by series of water-cooled shells. Stacked tuyeres suggested for controlling hanging and scaffolds. (D1b, 1-52; RM-h, CI-a)

55-D. Blast-Furnace Slags. B. G. Baldwin. *Iron and Steel,* v. 30, Oct. 9, 1957, p. 522-526.

Apparatus and experimental procedure used in study of liquidus temperatures, rate of melting, crystal growth, crystal movement and viscosity of 20 blast furnace slags representative of those of the United Kingdom. Chemical analysis of SiO_2, CaO, MgO, AlO and MnO and S content. Compares calculated and measured liquidus temperature; discusses primary phase composition, liquidus temperature, basicity and viscosity. (D11n, D1)

56-D. Commercial Vacuum Melting. *Iron and Steel,* v. 30, Nov. 1957, p. 591-594.

Small British vacuum melting installation, its operation and results obtained. (D8m, 1-55)

57-D. (Russian.) **Correction Method in Blast Furnace Operation.** A. N. Redko. *Metallurg,* v. 2, Sept. 1957, p. 3-5.

Relationship between change of optimum ore charge, temperature and humidity of blast, CO_2 content in the gas, specific slag output and coke consumption. Suggestions for immediate correction of the process to maintain silicon and sulphur contents constant. (D1b; Fe, *S, Si*)

58-D. (Russian.) **Control of Blast Furnace Operation by Static Pressures Differences.** P. G. Baranovskii and A. A. Kargin. *Metallurg,* v. 2, Sept. 1957, p. 5-7.
(D1b, Fe)

59-D. (Russian.) **Influence of Lithium Addition Upon Certain Properties of Austenitic Steel.** R. P. Zaletaeva. *Metallovedenie i Obrabotka Metallov,* v. 1, Sept. 1957, p. 25-27.

Introduction of up to 0.03% Li into austenitic steel considerably reduces contents of the gases in the steel. (D9s; ST, *Li,* AD-q)

60-D.* (Russian.) **Production of Pig Iron Using Oxygen Enriched Blast.** I. P. Bardin, S. K. Trekalo, A. F. Zakharov, F. A. Khilkevich and B. L. Lazarev. *Stal',* v. 17, Aug. 1957, p. 673-684.

Experimental smelting using prepared burden and oxygen-enriched blast. The efficiency of the process was improved. It was essential to use oxygen produced in large plants to lower cost of the process. (D1h; CI-a)

61-D. (Russian.) **Blast Furnace Run at 1.1 Atm. Pressure.** V. P. Onoprienko, B. N. Starshinov, A. A. Tkachenko, V. D. Sinitskii, L. M. Friedin and L. Ya. Portnyi. *Stal',* v. 17, Sept. 1957, p. 772-778.

Significant improvement of performance of the process was obtained. (D1h)

62-D. (Russian.) **Temperature Schedule of Openhearth Smelting of Phosphorus Pig Iron Using Oxygen.** I. A. Zaitsev. *Stal',* v. 17, Sept. 1957, p. 788-792.

6 ref. (D2g; ST)

63-D.* The Basic Roof-Extended Hearth-Use of Oxygen Firing Rates at Granite City Steel Co. Arthur L. How-

ard. *Blast Furnace and Steel Plant,* v. 46, Jan. 1958, p. 49-51.

The main disadvantage of the basic roof, in that it loses strength with high temperatures, is overweighed by the fact it can stand higher temperatures, in excess of 3500° F. compared with 3000 to 3100° F. for the silica brick roof. Higher temperatures, of course, mean shortened melt-down time, and thus less heat time. (D2, W18r; ST, RM-h)

64-D.* Heat Flow in Ingot Hot-Top. G. Fenton. *Blast Furnace and Steel Plant,* v. 46, Jan. 1958, p. 70-72.

Measurement of heat losses from the hot-tops of 9-in. square ingots have enabled the relative importance of the different heat losses, and their variation over the solidification period, to be assessed. The heat content of the refractory is shown to account for by far the greatest proportion of the total heat loss, so that the vtial property of any hot top tile is its thermal capacity rather than its conductivity. (D9m; ST, 5-59)

65-D.* Techniques and Problems in Vacuum Melting. Edward A. Loria. *Blast Furnace and Steel Plant,* v. 46, Jan. 1958, p. 73-78.

Vacuum melting, the variation of pressure and melt atmosphere during melting, refining and casting, exerts its major effect on the control of gas content and of minor elements (normally nongaseous). Involved in the former are melting atmosphere reactions, deoxidation practice and the control of gas evolution during solidification; while the latter is concerned with the removal of nongas trace elements by distillation and the control of refractory reactions. (D8m; ST)

66-D.* Recarburization of Molten Iron in a High Speed Rotary Vessel. R. I. Higgins and J. C. Billington. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Dec. 1957, p. 95–104.

Small-scale experiments which encourage the belief that this process could be conveniently achieved at low cost by dissolving coke breeze in the molten iron in a high-speed rotary vessel. An appreciable drop in temperature is associated with the recarburization of molten Fe by means of cold carbon additions, and although the experimental technique employed did not permit this to be measured, caculations have been made to indicate the magnitude of the effect. 11 ref. (D8n; ST)

67-D. Direct Reduction of Iron Ore in the United States. Harry W. McQuaid. *Iron and Steel Engineer,* v. 35, Jan. 1958, p. 69-77.

High investment cost of the blast furnace-openhearth combination has put it on the defensive, and the electric arc furnace is one way of meeting increased steel demand at a minimum capital cost. Since scrap supplies and prices are erratic, attention has been paid to the development of the direct reduction process. (D8j, A4s; ST)

104-D.* Possibilities of Desulphurizing Blast Furnace Hot Metal. Pt. 1. Additions of Aluminum Near Iron Notch During Casting. A. Banerjee, V. G. Paranjpe and S. Visvanathan. *Indian Institute of Metals, Transactions,* v. 10, 1956-57, p. 21-31.

Effects of Al additions are very marked with 0.8% Si hot metal but of low order in high-Si metal (1.48% Si). Almost negligible with metal containing 1.5% Si and 0.27% Ti, even if slag contains only 12% alumina. 8 ref.
(D11n, D1b; RM-q, Fe, *Al*)

105-D.* Possibility of Desulphurizing Blast Furnace Hot Metal. Pt. 2. By Injecting Fluidized Agents. P. K. Chakravarty, V. G. Paranjpe and S. Visvanathan. *Indian Institute of Metals, Transactions,* v. 10, 1956-57, p. 33-50.

Fluidized injection of calcium cyanamide, calcium silicide, high-grade lime, 1.5% of metal weight, and fluidized powder of white slag, containing above 1% carbide, effects over 60% desulphurization. Lime is upgraded with calcium silicide, fluorspar or Al. Basicity of slag affects rate of sulphur pickup. 19 ref. (D11n, D1b; RM-q)

106-D.* Distribution of Titanium Between Blast Furnace Metal and Slag. P. Mehta and V. G. Paranjpe. *Indian Institute of Metals, Transactions,* v. 10, 1956-57, p. 51-60.

Titanium content of local pig iron varies from 0.12 to 0.21%; increasing temperature increases extent of reduction. Reduction is correlated with Si using reaction index K_{Si-Ti}, which increases with basicity and is decreased by increasing titania content in slag. Manganese recovery is correlated with Ti content of metal. 11 ref.

Experiments conducted at Senelle Plant (openhearth) of Societe Lorraine-Escaut showed possibility of achieving a 29% rate of oxygen enrichment of air in gas producers with normal steam consumption, and of 27% in producers supercharged with steam, without any serious difficulty due to fusion of slag. Furnace performance was improved. At constant calorific output, productivity rose from 8.4 tons per hr. for operation with ordinary air to 9.7 for operation at rate of 29% oxygen enrichment, or an increase of 15.5%. Coal consumption decreased 13% under same conditions, costs of fabrication per ton did not increase. 25 ref. (D2g; ST)

The oxygen top blowing process in a stationary vessel was examined to determine possibility of obtaining dephosphorization without substantially affecting the carbon content of the iron. Emphasis placed on removal of phosphorus, rather than retention of carbon; necessity for extensive recarburization of the dephorized metal. Dephosphorization and recarburization can be carried out in the Kaldo converter with comparatively little phosphorus reversion. There may be several advantages in carrying out the recarburization treatment in a separate unfired vessel. 9 ref. (D10b; CI-a, *P*)

Development of electric furnace process in Norway and elsewhere. Importance of raw material preparation (concentration, sintering, preheating) for modern electric furnace operation. Possibilities of future competition between these and coke-fired blast furnaces. 7 ref. (D8n; Fe)

182-D.* (French.) **New Method of Improving Blowability in Thomas Converters.** B. Trentini, P. Vayssiere, D. Jorre and M. Gombert. *Institut de Recherches de la Siderurgie (IRSID), Publications,* Series A, no. 168, June 1957, 12 p.

Process permits insufflation of very diverse types of powdered materials under standard operating conditions of Thomas converter. At beginning of refining process, limited amount of powdered lime is injected into charge. Almost instantaneous action of this powder reaching place where oxygen of the blast reacts on bath prevents foaming of primary slag and thus improves blowability during critical blast period. Lime injection must be closely controlled. Silicon content of pig can exceed 1.5%; initial charge can be greater; time saving results; there is practically no increase in nitrogen content of steel. 5 ref. (D3b, 1-65; ST)

183-D.* (French.) **Conference on Energy (Metz, June 6, 1957).** *Revue de Metallurgie,* v. 55, Feb. 1958, p. 179-185.

Summary of eight papers on energy problems arising in blast furnaces and basic bessemer steel plants. Coke economy, large and small blast furnaces, preheating of the blast, energy balance in iron works; heat balance in basic bessemer conversion, in melting of scrap, energy consumption in basic bessemer plant; recovery of heat

from flame of basic bessemer converter. (D1, D3b, 1-65, A11e; ST)

198-D.* (English.) **The Importance of Vacuum Casting in the Steel Industry.** F. Kinsky and Z. Kletecka. *Czechoslovak Heavy Industry*, no. 2, 057, p. 3-21.

Effect of hydrogen content on properties of steel, experimental results obtained in vacuum casting of steel ingots including effects of dendritic structure, grain size, oxide inclusions, occurrence and character of segregations, hydrogen content and resultant mechanical properties. 7 ref. (D8m; ST, 9-69)

199-D.* (French.) **Gasification With Oxygen-Enriched Blast Air.** R. Alleyrac, L. de Saint Martin, R. Veuve and P. Leroy. *Publications de l'Institut de Recherches de la Sidérurgie,* Series A, no. 173, Sept. 1957.

Use of oxygen-enriched air for the blast furnace. A gain in the lower calorific value of the dry and purified gas of 350 k.-cal. per sq. m. is obtained in using 29% oxygen-enriched air in place of ordinary air. Furnace performance is likewise improved; a 15.5% gain in tons per hr. produced is obtained with the enriched as compared with the normal air. Also a gain in coal consumption. In general, production cost tends to decrease. (D1h)

200-D. (German.) **Operational Results Obtained When Blowing Basic Converter Heats by the IRSID Opacimeter.** Hans von Ende and Gustav Mahn. *Stahl und Eisen,* v. 78, Apr. 3, 1958, p. 412-416.

Replacement of two-period system by the four-period system brings performance of control system closer to optimum level of furnace. (D2h, RM-k30 18-74)

207-D. (Russian.) **Development of Melting and Pouring Technology for High-Chromium-Nickel-Molybdenum Steel.** V. I. D'iachkov, P. V. Umrikhim, S. G. Slesarev and I. G. Fadeev. *Stal',* Feb. 1958, p. 120-126.

A sharp reduction of rejected billets and finished products has been achieved by alloying of the boiling bath with ferrochrome and pouring of steel by use of frames. 8 ref. (D9p, D9r; SS, AD-n31)

208-D. (Russian.) **Production of Two-Layer Ingots and Slabs.** V. A. Filonov, A. A. Podgorodetskii, F. A. Ksenzuk and V. N. Lola. *Stal',* Feb. 1958, p. 188-191.

(D9)

209-D.* (Swedish.) **Gaseous Mixing in Connection With Combustion in Metallurgical Furnaces.** Erik E. Sjöstrand. *Jernkontorets Annaler,* v. 142, Jan. 1958, p. 15-33.

Critical review of work published in the last 20 years covering gaseous mixtures, openhearth furnaces, port design, gas transit time, gas flow, application of aerodynamics to openhearth development and photographic techniques in combustion research. 20 ref. (D2, D11j)

210-D. Equilibria of Molten Iron and Liquid Slags of the System CaO-SiO_2-FeO. H. L. Bishop, Jr., N. J. Grant and J. Chipman. *AIME Transactions,* v. 212, Apr. 1958, p. 181-192.

Lime and dicalcium silicate crucibles were equilibrated with molten iron and liquid slags containing iron oxide and small amounts of sulphur. Oxygen content of metal, iron oxide activities and desulphurization val-

ues of the slags were determined in the temperature range 1530 to 1700° C. Influence of magnesia in the slag and the temperature dependence of the solubility of lime in liquid iron oxide and the ferric oxide content were established. 17 ref. (D11n, D2d, P12, Fe)

211-D. The Behavior of Chromium in Slag-Metal Systems Under Reducing Conditions. C. W. McCoy and W. O. Philbrook. *AIME Transactions,* v. 212, Apr. 1958, p. 226-235.

Reduction of chromous oxide from lime-silica-alumina slags by carbon-saturated iron behaves as a first-order process substantially independent of slag composition and temperature over an important range for iron smelting. 16 ref. (D11n, ST, *Cr*)

212-D. Russian Experience With 500-Ton Open Hearth Furnaces. R. Sewell. *Blast Furnace and Steel Plant,* v. 46, Apr. 1958, p. 50-52.

(D2, W18r)

213-D. New Trends in Firing Practices for Open Hearth Furnaces. James E. Goodin. *Blast Furnace and Steel Plant,* v. 46, Apr. 1958, p. 389-390.

Experiences and results using high-pressure natural gas to replace steam as atomizing agent in open-hearth furnaces; safety equipment. (D2, W18r; RM-m)

214-D. Gary Works' Experiences With Quartzite Blow-Outs. R. E. Turman and T. A. Young, Jr. *Blast Furnace and Steel Plant,* v. 46, Apr. 1958, p. 391-395.

Experiences with three quartzite-type blast furnace blow-outs illustrate advantages. Conditions for satisfactory quartzite blow-outs are: quartzite burden interface occurring above the mantel; 20% reduction of burden in advance of lowering blast temperature to 600° F.; filling sequence to maintain quartzite at correct level; quartzite temperatures measured and maintained below 2500° F.; quartzite particle size ranging from 1 to 2 in. with minimum of fines. (D1, W17g)

215-D. Use of Oxygen in the British and European Steel Industries. D. J. O. Brandt. *Iron and Coal Trades Review,* v. 176, Jan. 1958, p. 263-271.

18 ref. (D-general, D10; ST, *O*)

216-D. Titanium-Bearing Stainless Steel. Slag Washing Process. *Iron and Coal Trades Review,* v. 176, Mar. 28, 1958, p. 751.

As molten stainless steel flows through the high-temperature slag, a washing action is developed, and this cleans the steel of any contaminants. When the molten steel rises in the mold, the slag forms a protective covering over the entire surface preventing air oxidation. The extremely hot slag also retards the rate of solidification, allowing any remaining contaminants to float to the top where they can be discarded. (D11n; SS, *Ti*)

217-D.* High-Phosphorus Pig Iron Refined With Lime and Oxygen. B. Trentini and M. Allard. Digest of paper presented before the 15th annual A.I.M.E. Electric Furnace Steel Conference, Feb. 1958. *Metal Progress,* v. 73, May 1958, p. 145-146, 148.

It is now possible to produce steel from high-phosphorus pig iron by the basic oxygen process. When lime powder is injected along with oxygen blast, the phosphorus is fluxed away and the steel is fully equivalent to that produced in the openhearth. (D3b; ST)

218-D.* Modern Trends in Iron and Steel Making. E. Klein. *South African Mechanical Engineer,* v. 7, Feb. 1958, p. 203-224.

Increase in iron production by larger number of units, larger units, better exploitation of existing units; physical burdening, high top pressure. Ore agglomeration by sintering and pelletizing; ore bedding; upgrading of ore by beneficiation; heavy media separation, cyclone; roasting and magnetic separation; enriched blast; low-shaft furnace. Steelmaking pneumatic processes, new concepts through application of oxygen; L. D., Graef Rotor and Kaldo process; electric arc furnace; openhearth process. (D-general)

219-D. Study of the Effects of Vacuum Melting on 550° F. Tempering Embrittlement. M. Gensamer. Columbia University. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131358, Jan. 1957, 41 p. $1.25.

At 550° F., temper embrittlement, common in alloy steel, can be eliminated in SAE 1340 through purification by vacuum melting in a system embodying the principles of the molecular still. (D8m, Q26s; ST)

220-D. Use of Compressed Air for a Sharper Flame in the Openhearth Furnace. M. G. Kozhanov and G. B.

Rogov. *Metallurg*, v. 1, no. 7, 1956, p. 18-21. (Henry Brutcher, Altadena, Calif., Translation no. 3916.)

Effect in steelmaking of a liquid slag on a porous solid and on a refractory. 30 ref. (D11, ST, RM-h, RM-q)

239-D.* (Japanese.) **Measurement of Gas Temperature in Blast Furnace Operation and Its Utilization.** Masamoto Nose and Kenichi Kasai. *Sumitomo Metals*, v. 9, Oct. 1957, p. 196-206.

Measurement of temperature, analysis and velocity continuously provides effective control. A German-type gas sampler was employed. Mechanism and operating methods; relation between CO and CO_2 content and gas temperature; temperature classification of gas distribution, ideal, normal and abnormal; influence of size and kind of charged material on gas distribution; estimation of permeability by measuring pressure. (D1b, S18q)

240-D. (Rumanian.) **Desulphurizing Power of Blast Furnace Slags. Sulphur Absorption Capacity of the Slags of the System SiO_2-CaO-FeO in the Liquid State at 500° C.** Traian T. Negrescu. *Studii si Cercetari de Metalurgie*, v. 2, no. 1-2, 1957, p. 37-68.

19 ref. (D1, D11n; Fe, *S*)

241-D. (Rumanian.) **Desulphurizing Power of Blast Furnace Slags. Pt. 6. Sulphur Absorption Capacity of the Slags of the System SiO_2-CaO-MnO in the Liquid State at 1425° C.** Traian T. Negrescu. *Studii si Cercetari de Metalurgie*, v. 2, no. 3, 1957, p. 265-288.

7 ref. (D1, D11n; *S*)

242-D.* (Russian.) **Improved Blast Furnace Charging Bell.** Yu. A. Popov, K. G. Umrikhin and A. K. Shaposhnikov. *Stal'*, Jan. 1958, p. 7-14.

Charging bell meets all operational requirements and has the following advantages: spreads the charge concentrically according to size and chemical composition; maintains continuous radial distribution; avoids necessity of sealing the rotary distributor; simplifies furnace management; increases production and lowers coke consuption. (D1a, 1-52)

243-D. (Russian.) **Smelting of Low-Manganese Iron From Krivoy Rog Ore With Donetz Coke.** P. G. Glazkov, N. E. Dunaev, A. G. Kuzub and G. A. Panev. *Stal'*, Jan. 1958 p. 14-20.

Effective smelting of low-manganese iron depends on the tenor of the Mn ore, production of slag with correct composition, the use of metal additives, Mn content of the cast iron and basicity of the slag. To hold sulphur within acceptable range the basicity of the final slag was increased by raising its alumina content to 8.5% and that of magnesia to 2.5%. 7 ref. (D1, D11n; Fe, *Mn*)

244-D.* (Russian.) **The Quality of Steel Produced From Cast Iron**

Smelted With Constant Moisture Air Blast. M. I. Kolosov, A. N. Morozov, A. I. Stroganov, Yu. A. Popov, O. Ya. Vainshtein and N. V. Keis. *Stal'*, Jan. 1958, p. 24-27.

Introduction of constant moisture air blast in the production of high-quality steel did not cause undesirable increase in hydrogen content nor tendency toward cracking. Macrostructure and physical properties of the steel produced do not depend on the method of smelting. 6 ref. (D1)

245-D.* (Russian.) **Production of Tube-Steel by the Scrap Process From Low-Manganese Cast Iron With Different Manganese Content in the Melt.** A. I. Pastukhov, K. M. Petrov and A. M. Danilov. *Stal'*, Jan. 1958, p. 28-34.

Experimental results proved the necessity of maintaining the required Mn content in the melt during the entire heat in place of the usual addition of ferromanganese. Speed of burning out carbon, desulphurization and dephosphorization of the metal, chemical content of the slag, gas and nonmetallic inclusions in the metal and its phyical properties. 21 ref.

Shifting the production of ball-bearing steel, ShX 15, to openhearth furnaces fired with fuel oil-enriched natural gas resulted in greater purity of the metal and reduced the interval between tappings to 35 min. Technical factors affecting contamination of steel, nature and content of nonmetallic inclusions.
(D2, 1-64; ST, SGA-c, RM-k, RM-m)

247-D.* (Russian.) **Intensification of Oxidizing Period in Electric Furnace Melting of Structural Steel.** F. P. Edneral and N. F. Khlistov. *Stal'*, Jan. 1958, p. 43-48. (Also Henry Brutcher, Altadena, Calif., Translation no. 4165.)

The oxidizing period was reduced by 30% with injection of oxygen at the end of the period to assure proper dephosphorization and decarbonization. It is recommended that the basicity of the slag in the melt be less than 2.2, and the heat of the metal 1500° C.

Development of sulphides is connected with the process of solidification. This may be observed by Bauman's test which produces impression of dendritic crystals. In nonmanganese steels sulphides crystallize at 988° C. In Mn and other alloy steels inclusions develop at higher temperatures depending on

sulphur content and on its correlation with Fe, Mn, Al and Si which may enter into their composition. 14 ref. (D11s, N12; ST, 9-69)

352-D.* (Russian.) **Investigation of Sinter Formed During Oxidation of Iron in Carbon Dioxide Gas.** V. I. Arkharov. *Fizika Metallov i Metallovedenie*, v. 5, no. 2, 1957, p. 251-254.

X-ray study of oxidation of iron in CO_2. The first stage of the reaction is limited by the speed of oxygen supplied to area of reaction. This results in formation of layer of FeO. In subsequent phase, the process is limited by the continuously slowing supply of iron to area of the reaction. This results in formation of an outer layer of Fe_3O_4 (on top of layer FeO). The further structural picture of oxidation in CO_2 is similar to that in steam. The differences in flow between these two stages can be explained by differences in adsorption and desorption of the gaseous components. 6 ref. (D1, R1h; Fe)

353-D.* **Desulfurization of Iron and Steel.** S. L. Gertsman. *Foundry*, v. 86, Aug. 1958, p. 48-53.

More than 85 heats of acid and basic electric and basic induction steel have been desulphurized by lancing with a carrier gas. Reductions of up to 40% of the steel's original sulphur content can be obtained by lancing basic induction and acid electric steel in the ladle. This operation takes about 2 min. for a 500-lb. melt and is accompanied by a considerable drop in temperature (75 to 150° F.). (D11s)

354-D.* **Automatic Charging Control for No. 3 Fairless Blast Furnace.** S. P. Curtis, R. F. Schramm and D. W. Fath. *Iron and Steel Engineer*, v. 35, July 1958, p. 73-84.

Charging control for new furnace represents combined knowledge and efforts of operators, furnace builders and control engineers; permits greater flexibility in choosing charging cycles, provides more information to operators and maintenance personnel. (D1a, W17g)

Sponge iron furnace operating experience; furnaces found reliable with annual capacity of 30,000 tons sintered pellets suitable as raw material. Coke used as fuel. L.P. gas added to reduction gas increased production and lowered consumption of coke and electrical energy. 9 ref. (D8j)

362-D.* (Russian.) **Improvement in the Quality of the Mixture for Self-Sintering Electrodes.** V. V. Rukavishnikov, *Stal',* v. 18, Mar. 1958, p. 281-285.

To overcome uneven performance of electrodes in ferro-alloy electric arc furnaces, the mix from which the electrode is formed should contain no more than 10% cinder, the discharge of volatile elements should range between 14 to 18% and the ingredients should be uniformly mixed and all foreign substances carefully excluded.
(D5, W18s, T1f, 17-57)

363-D. New Way of Producing Carbon-Free Ferrochromium. I. D. Kirichenko. *Stal',* v. 18, no. 2, 1958, p. 131-137. (Henry Brutcher, Altadena, Calif., Translation no. 4193.)

Development of an economical process for removing carbon from solid high, medium or low-carbon ferrochromiums in vacuum with rich iron ore, nickelous oxide, ferrochromium previously oxidized, etc., making it possible to produce carbon-free ferrochromium with 0.01-0.03% carbon and low silicon content. Thermodynamic analysis of process, claimed to prove that American data on the decarburizing reaction involved are incorrect and that silicon is *not* the best deoxidizer. Confirmation of calculations and deductions by actual experiments. Laboratory furnaces used for study of kinetics of process and determination of its end. Results obtained. Pilot vacuum furnace for production trials. How grinding of the new carbon-free ferrochromium can be facilitated and how the quality of 18-8 steel can be improved by its use.

405-D. (Russian.) **Effectiveness of Use of Oxygen in Ferrous Metallurgy.** V. F. Andreev. *Stal'*, June 1958, p. 561-568.

Production of steel by use of oxygen in converter is 50% cheaper than by openhearth. Soviet steel industry plans to increase output of steel by oxygen to 40% of total steel production. 13 ref. (D-general, A4p; O)

406-D.* **Vacuum Pouring of Ingots for Heavy Forgings.** J. H. Stoll. *Blast Furnace and Steel Plant*, v. 46, June 1958, p. 595-605.

Bethlehem Steel's research in vacuum pouring of ingots results in a process which cuts down on hydrogen content and prevents flaking in steel. A 7-ton and two 250-ton vacuum degassing units, composed of a mold within a sealed chamber, were set up and pouring made and tested. Hydrogen content averaged 0.5 parts per million against 1.5 parts in air cast material. Ductility and cleanliness were superior in vacuum casting. Initial and operating costs are much higher and hazards greater but process has proved practical for higher quality steel.

Operating principles of methods for making pig or sponge iron by means other than the blast furnace. (D8; 10-54)

421-D.* (French.) Relation of Blast Furnace Process to Hydraulic Value of Slag. J. Roquejoffre. *Revue des Materiaux,* no. 512, May 1958, p. 119-135.

Grinding tests were conducted on 21 samples of granulated slag from blast furnaces charged with identical ore and producing basic pig of same quality. Reactivity of slag was found to be related to its density, with density depending on fineness after grinding. Second series of tests was conducted on 52 samples taken from same furnace and ground to same degree of fineness and relation between blast furnace process and hydraulic value of slag was investigated. Run-off temperature of slag determines initial reactivity, and run-off temperature, density and $CaO:SiO_2$ ratio are closely interdependent. Compressive strengths of cements made from these slags were conditioned by apparent density of slag and run-off temperature.

Reduction test carried out in barrel-shaped rotor laboratory furnace. Degree of oxidation after termination of test at 1000° C. indicates reducibility. Quantity of firing indicates disintegration during reduction. Satisfactory agreement was obtained between test and indirect reduction in blast furnace. 8 ref. (D1a, D11g, D11r; RM-n)

427-D.* (Hungarian.) Effect of Steam Injection on Blast Furnace Operation. Otto Farkas. *Kohaszati Lapok*, v. 91, Apr. 1958, p. 186-190.

Steam injection increases somewhat the amplitude of oxidizing zone, if in order to balance heat consumption of steam decomposition, temperature of blast steam is increased. Increase of moisture of blast injection changes composition of the air and that of gas formed in the blast. As a result of steam decomposition, oxygen and hydrogen contents of injection increase but nitrogen content decreases. Practically the entire quantity of hydrogen formed through decomposition of moisture takes part in reduction process and consequently the throat gas H_2 leaving the furnace increases little, and not in proportion to the humidity. Moisture content of blast may be increased to 30 g. per cu. m. without increasing the quantity of hydrogen in the raw iron. Higher humidity content of the blast stream results in decreased energy consumption. 11 ref. (D1h)

443-D.* (German.) **Studies on Flow in Openhearth Furnace Regenerators With a Laboratory Model.** Michael Hansen. *Stahl und Eisen,* v. 78, June 12, 1958, p. 804-812.

An air current was led into a model checker chamber and the influence of different ratios of inside dimensions of distribution to main inside dimensions of checkerwork studied. Effects of a collection main leading in the same direction as the distribution main and a collection main leading in inverse direction. Placing the checker chamber under the superstructure of the furnace allows a flow parallel to a vertical plane within the distribution main and the checker chamber. (D2, S18q, W18r)

444-D.* Some Observations on the Slag Metal Equilibria Involved in Ferromanganese Production. N. J. Wadia, V. G. Paranjpe and S. Visvanathan. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 83-109.

Slag-metal equilibria in Mn-rich burdens were investigated to ascertain the effects of Mn content of the metal, slag composition and basicity, and temperature on the Mn and S distribution coefficients. The desulphurization reaction in Mn burdens follows the same pattern as in ironmaking, with the exception that the slags have a higher sulphur-bearing capacity owing to the formation of manganese sulphide. 28 ref. (D11n; Mn, Fe, AD-n)

445-D.* Desulphurization of Alloys in Hydrogen. B. Chatterjee and K. R. Sangameswaran. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 161-165.

Studies of removal of sulphur from powdered samples prepared from two specimens of cast iron and from fine drillings prepared from two samples of steel on heating for varying periods of time at 1000° C. in a current of dry hydrogen and in hydrogen containing 1.2% by volume of moisture. Moist hydrogen is more effective than dry hydrogen. 6 ref. (D11n; *S, H*)

446-D.* Direct Reduction of Iron Ore to Yield Usable Steel. Jatinder Mohan, P. K. Gupte and B. R. Nijhawan. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 247-262.

Crushed iron ore, dried and ground preferably finer than 70 mesh, is packed in a paper tube and embedded in solid charcoal in a sealed steel canister. The canister is heated to the reduction temperature and then raised to a sintering temperature of the order of 1100° C. for several hours depending on the carbon content required in the steel. A fairly compact steel bar is obtained after reduction which lends itself readily to hot working. 6 ref. (D8j; ST)

447-D.* Continuous Casting of Steel. V. Yavoisky and P. K. Sen. *Indian Institute of Metals, Transactions,* v. 11, June 1958, p. 27-56.

Advantages of continuous casting of steel over normal casting practice. Thermal loss in the process, and heat exchange in the ingot, both in the primary stage of solidification in the water-cooled mold, and in the subsequent stage of complete solidification outside the mold. Characteristics of the crystalline structure govern the nature of in-

side and outside defects of the ingots. 11 ref. (D9q, N12; ST)

467-D.* (German.) **Properties of Iron and Steel Melts in High Vacuum.** Wilhelm Anton Fischer and Alfred Hoffmann. *Archiv für das Eisenhüttenwesen,* v. 29, June 1958, p. 339-349.

On heats with 0.001 to 3.5% C the properties of iron in high vacuum (10^{-5} to 10^{-3}) were observed and the behavior of nonmetallic elements (N, H, P, As, S, C, O) and metallic impurities (Mn, Si, Cu, Mg, Ca, Al, Zr) was studied in relation to melting time and refractory material. Refractories were electromagnesia, electrocorundum, statistical zirconium oxide, calcium carbonate, lime and dolomite. 35 ref. (D8m; Fe, RM-h)

468-D.* (German.) **Plant Experiments on the Smelting of (African) Conakry-Ore. Pt. 2. Removal of Chromium by Supplying Pure Oxygen to the Melt.** Wilhelm Wolf, Wilhelm vor dem Esche, Otto Steinhauer and Helmut Wysocki. *Stahl und Eisen,* v. 78, Aug. 7, 1958, p. 1100-1107.

By supplying pure oxygen under the surface of a basic bessemer melt, the Cr content was reduced from 0.8% to 0.1%. Temperature regulated by adding partly deoxidized roll scale. Oxidation of elements present in Fe occurs in the sequence: Si, Mn, V, Cr. It is necessary to completely oxidize the Si and to rather completely oxidize the Mn, before Cr can be attacked. A certain amount of oxidation of C and P is inevitable. 8 ref. (D3, D11r; *Cr*)

469-D.* (Russian.) **Production of Fluxed Sinter From Kerch Iron Ores and Its Use in Blast Furnaces.** I. V. Raspopov, Ya. S. Gorbanev and D. V. Gulyga. *Stal'*, v. 18, Aug. 1958, p. 676-682.

Use of Kamyshburun sinter in 'Azovstal' blast furnaces improved quality and reduced costs. Recommends better separation of sinter fines by screening at sintering plant and sharp reduction of the number of sinter reloadings during transportation and at plant. By charging blast furnace with 80% sinter and 20% iron ore with increased basicity to 0.6 resulted in a 6% increase in blast furnace productivity, an 8% reduction in unit expenditure of coke, a 10 ruble reduction in cost per ton of pig iron and a 32% decrease in limestone. (D1a, B16a; Fe)

470-D.* (Russian.) **Investigation of Descent of Burden Materials in Blast Furnace by Radioactive Indicators.** G. G. Lukashev, Ya. S. Gorbanev and L. D. Prikhod'ko. *Stal'*, v. 18, Aug. 1958, p. 682-687.

Distribution speeds of burden over furnace cross section and along its height. Burden moves with minimum speed at periphery and maximum speed at the coke combustion zones near the tuyeres. Under given conditions materials can move with maximum speed at the axial part of furnace. Maximum speed is at the upper part—to 10 m. per hr. It slows down at the mid part to 4-5 m. and at the lower third to 3.5 m per hr. (D1a, 1-59)

471-D.* (Russian.) **Preliminary Refining of Pig Iron in Ladles by Injection of Steam-Oxygen Mixture.** Ya. A. Shneerov, A. G. Derfel' and A. G. Kotin. *Stal'*, v. 18, Aug. 1958, p. 694-702.

Injection of steam-oxygen reduces Si, Mn, C and S, but does not reduce the P content. Introduction of oxidizing and slag-forming additions speeds oxidation and increases the pig iron temperature to a certain extent. There is a 0.15% loss of metal as result of steam-oxygen injection. 7 ref. (D1d, D1h)

472-D.* (Russian.) **Mass Production of Semi-Killed Steel for Manufacture of Mine Supports.** V. V. Leporskii, S. S. Petrov and V. M. Presnyakov. *Stal'*, v. 18, Aug. 1958, p. 702-706.

Production of semikilled Si-free steel containing approximately 1.0% Mn, which equals in quality killed steel for mine supports, considerably increased the output of rolled steel due to the reduction in cropping in the blooming mill and improved performance in the open-hearth. Production practice for semikilled steel is similar to that of rimming steel of ordinary quality. Most effective way of reducing semikilled steel is by addition of ferromanganese to furnace and to ladle. 4 ref. (D2, T28m, 17-57; ST-k)

473-D.* (Russian.) **Optimum Temperature Conditions for Melting Rimming Steel Using Phosphorus Iron.** A. S. Kharitonov and M. T. Bul'skii. *Stal'*, v. 18, Aug. 1958, p. 706-709.

Rimming steel made in rotary openhearth furnace with charge containing 75% phosphorus iron with composition of 0.6% Si, 2.0% Mn, 1.6% P and 0.08% S. The starting temperature was between 1510 and 1590° and before reduction it rose to 1570-1640°. (D2; ST-d)

474-D.* **Modern Attacks on Iron Ores.** C. F. Hoffman. *Metal Progress,* v. 74, Sept. 1958, p. 67-70.

While direct reduction will be applied commercially in some locations it will not supplant the blast furnace, one of the most efficient metallurgical tools in use. To meet the increased future needs for more Fe, steel mills will strive for higher production from existing furnaces by means of technological improvements. With beneficiated raw materials and newly developed uses of oxygen and other techniques, production in the same size blast furnace used in 1940 can be increased 67%. (D1, D8, B16; Fe)

475-D.* (Russian.) **Refining of Iron in Ladle With Steam-Oxygen Mix.** Ya. A. Shneerov, A. G. Derfel' and A. G. Kotin. *Metallurg,* v. 3, Aug. 1958, p. 11-14.

To make the maximum use of oxygen the Azovstal' plant experimented with preliminary refining of pig iron with oxygen in the ladle. This lowers the Si content from 0.7 to 0.3% with a resultant 15% increase of openhearth productivity. To get the best results with oxygen-treated pig iron, it is necessary to substantially increase the proportion of pig within the over-all metal portion of the charge. At Azovstal', pig iron makes up 75% of the metal in the charge. Lowering Si content of charge makes possible a phosphate slag with increased content of P_2O_5. (D9m, D11r; CI-a)

487-D.* (Russian.) **Melting Transformer Steel Under Vacuum.** I. S. Prvanishnikov. *Metallurg,* v. 3, Sept. 1958, p. 16-17.

Sixteen test melts were made in vacuum furnace with 150-kg. capacity in melting transformer steel under vacuum of 0.5-1.0 mm. Hg. Conclusions were that vacuum should be used only after melting of the charge. It is better to pour metal without vacuum, preferably in an inert atmosphere. Ferrosilicon should be introduced under vacuum. To sublimate Si from liquid metal, the metal with Si should be exposed under vacuum at 0.5-1.0 mm. Hg for no longer than 10 min. (D8m; ST, SGA-n)

488-D.* (Russian.) **On Overcharging Electric Furnaces.** A. I. Sapko and Z. I. Sapko. *Metallurg,* v. 3, Sept. 1958, p. 20-21.

There is a danger in overcharging furnace by more than 30% without reconstructing it and increasing power of its transformers. Contrary to expectation, overloading furnace does not increase output but disorients and disrupts equilibrium, thus lowering productivity. Increases in furnace output should be sought in the direction of improving the electrical regime of the furnace; intensification of melting by use of oxygen; improving mechanical equipment for air-blast.
(D5; ST)

489-D.* (Rumanian.) **Desulphurizing Power of Blast Furnace Slags Ability of Liquid Slags of SiO_2-Al_2O_3-CaO System to Absorb Sulphur at Temperatures of 1460 and 1550° C.** Traian Tr. Negrescu. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 49-64.

Experimental slags were prepared by melting in the electric furnace at 1460 and 1550° mixtures of 10 g. of pure silica, alumina and calcium oxide in the presence of synthetic pig iron (24 g.) without manganese but containing 0.8% sulphur. The purpose was to determine the maximum quantity of sulphur which can be absorbed by 100 g. of each one of the slags under conditions of equilibrium. The results confirm the fact that in liquid slags of the ternary system SiO_2-Al_2O_3-CaO, the silica present combines with a part of the lime to form groups which are inactive from the point of view of desulphurization. Aluminum does not participate directly in the desulphurization process in the temperature ranges investigated. Thus the desulphurization is due only to that part of the lime which is not tied up in the formation of the 5 CaO·8 SiO_2. 3 ref. (D11n, D1)

490-D. (Russian.) **Production of Open-hearth Phosphate-Slag at the Azovstal' Mill.** F. F. Zviridenko and A. N. Popova. *Metallurg,* v. 3, Aug. 1958, p. 20-22.

(D8n)

504-D. Lighting Flicker Caused by Electric Arc Furnaces. W. E. Schwabe. *Iron and Steel Engineer,* v. 35, Aug. 1958, p. 93-100.

Erratic changes of arc length caused by external and internal forces and random contacts between collapsing scrap are responsible for current swings. Degree of disturbance depends on relation of furnace load to capacity and network of the local power system. Hollow electrodes reduce swings appreciably; while sensitivity of incandescent light bulbs decreases with increasing wattage rating of the bulbs. (D5, W18s; ST)

505-D. Kinetics of Reduction of Magnetic Iron Ore at the Transformation Temperatures of Iron. M. I. Kochnev and A. F. Plotnikova. *Izvestiya Akademiia Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 4, 1958, p. 118-121. (Henry Brutcher, Altadena, Calif., Translation no. 4340.)

Search for a possible relationship between change in properties of iron at its transformation temperatures and rate of reduction of iron oxides under the same conditions. Data on fluctuations of rate of reduction of magnetite by hydrogen as function of temperature. Changes in electronic state of the iron atoms and not of the crystal lattice as basic cause of anomalies in chemical and physical processes.

10 ref. (D9q; ST)

514-D. **Slag—Iron-Blast-Furnace.** Wallace W. Key. *U. S. Bureau of Mines Minerals Yearbook, Preprint,* 1957, 9 p.

Production, consumption and technology of steelmaking slags. (D1g; RM-q)

515-D. **Vacuum Melting of Steels and Other Iron-Base Alloys.** H. Zakowa. *Instytutow Ministerstwa Hutnictwa,* v. 8, no. 8, p. 207-214. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB70.)

Previously abstracted from original. See item 402-D, 1956. (D8; ST)

516-D. **Processes Occurring in the Bosh of Blast Furnaces Operated on Oxygen-Enriched Blast.** I. P. Bardin and M. Ya. Ostroukhov. *Izvestiya Akademiia Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 2, Feb. 1958, p. 7-14. (Henry Brutcher, Altadena, Calif., Translation no. 4299.)

Data on processes obtained with improved sampling equipment. Causes of irregular working of furnace when on O_2-enriched blast. (D1b, D1h; Fe, *O*)

517-D. **A Blast-Furnace Top Distributor of New Design.** A. S. Ayukov. *Stal',* v. 16, no. 11, 1956, p. 975-976. (Henry Brutcher, Altadena, Calif., Translation no. 4309.)

Advantages. Reliable sealing of top charging equipment; operational dependability at increased internal furnace pressures; simple construction; economical operation. (D1, W17g; 17-51)

518-D. **Operation of Russian Blast Furnaces With a High Top Pressure of 1.3 Atms.** E. G. Tetereviatnikov. *Stal',* v. 17, Mar. 1957, p. 200. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB70.)

Previously abstracted from original. See item no. 291-D, 1957. (D1h, 1-52; Fe)

519-D. **Study of Secondary Cooling With Air-Water Mixtures in Continuous Casting.** A. D. Akimenko. *Stal',* v. 18, no. 6, 1958, p. 509-511. (Henry Brutcher, Altadena, Calif., Translation no. 4310.)

Preliminary experiments on secondary cooling of continuous-cast billets with mixtures of water and air instead of water sprays alone. (D9q)

520-D. **Experience in the Production and Hot Working of Light-Section Continuous Cast Steel.** F. Leitner and F. Schmidt. *Stahl und Eisen,* v. 78, no. 15, 1958, p. 1028-1032. (Henry Brutcher, Altadena, Calif., Translation no. 4330.)

Design characteristics of Breitenfeld (Austria) continuous casting plant. Casting practice. Advantages and fields of application. (D9q; ST)

521-D. (Russian.) **Efficient Method for Charging Blast Furnaces.** L. Ya. Shparber. *Metallurg,* v. 3, Sept. 1958, p. 10-11.

Automation of charging of large blast furnaces; assembly, weighing and mixing of materials using a scale car, charging skip and tubular vibratory conveyors. (D1a, W12b)

522-D.* (German.) **Behavior of Various Slag Compositions During Operation and Their Influence Upon Production Results.** Wolfgang Heerwagen. *Neue Hutte,* v. 3, June 1958, p. 351-357.

In a Renn furnace experiments were conducted to determine optimal slag composition. The ratio $CaO + MgO = 0.18$ up to 0.19 was found to be more advantageous than more basic slags. Influence of CaO, clay, and other oxides. Operating results evaluated graphically. (D11n; ST)

523-D.* (German.) **Behavior of Chromium in the Basic Bessemer Converter.** Paul Goldstein and Erwin Eickworth. *Stahl und Eisen,* v. 78, Sept. 4, 1958, p. 1235-1246.

Chromium percentages up to 1.85% can be reduced to 0.1% by

pre-refining with air or air plus oxygen. If a Cr content of 0.06% in the steel is not to be exceeded, a percentage of less than 0.15% in the crude iron is suggested. Recommended initial temperature in refining: 1400° C.; reduced temperature during second half of time, final temperature: 1350° C. Sufficient slag quantity important; with 1.85% Cr, 100 kg. slag per ton iron, high Cr percentage in rimmed steel is harmful in rolling.
(D3, 1-65; AY, *Cr*)

524-D.* (German.) **Experiments on Reduced Top Discards of Steel Ingots.** Alfred Theis and Karl Nitschke. *Stahl und Eisen,* v. 78, Oct. 2, 1958, p. 1380-1383.

Experiments on 18% Cr, 8% Ni steels performed with usual exothermic feeding powders gave no satisfactory results. Neither did rammed top linings in the nozzle. Weight of top discard could be reduced 50% by the use of pressed exothermic inserts and feeding powder. (D9; ST)

525-D.* **Blast Furnace Bypass.** *Chemical Week,* v. 83, Oct. 11, 1958, p. 82, 84.

Strategic-Udy electric-arc smelting technique results in excellent performance in direct reduction of iron ore. (D8n; Fe)

526-D.* **Bottom-Blow Converter.** Marc Allard. *Iron and Coal Trades Review,* v. 177, Sept. 5, 1958, p. 560-563.

Reviews work done in France on improvement of basic bessemer steelmaking process. Suppression of "slopping" by altering the shape of the vessel, controlling the blast volume, and use of finely-divided lime in the blast to insure quick fluxing of the primary, normally highly siliceous slag. 10 ref. (D3)

527-D.* (Czech.) **Improvement of Openhearth Process by Means of Oxygen.** Ivan Pavlovic Bardin. *Hutnicke Listy,* v. 13, Oct. 1958, p. 863-868.

Consumption of 25 to 35 cu. m. of oxygen per ton of steel increases maximum output of furnaces by 17 to 20% and fuel economy rises from 10 to 15%. Oxygen is injected directly by nozzles placed in roofs of openhearth or arc furnaces. Where steel is produced from pig iron rich in phosphorus, oxygen is injected into the bath. In all cases successful use of oxygen can only be effected if the furnaces have basic roofs. (D2g; *O*)

528-D.* (Czech.) **Use of Oxygen-Enriched Blast in Soviet Blast Furnaces.** M. A. Shapovalov. *Hutnicke Listy,* v. 13, Oct. 1958, p. 872-878.

Use of blast enriched with 27% O_2 in production of foundry pig iron and blast enriched by 25% O_2 for production of openhearth pig iron results in an increase of 20% and 14-15% respectively in productivity, coke consumption remaining the same. Blast enriched by O_2 during production of ferromanganese and ferrosilicon results in similar increases in yield and a reduction in coke consumption.
(D1h, *O*)

529-D.* (German.) **Metallurgy of the Low Shaft Furnace.** Karl-Friedrich Ludemann. *Neue Hütte,* v. 3, Sept. 1958, p. 523-533.

Ores melted in a low-shaft furnace with 1.35 to 22.27% Fe, varying amounts of Mn, P, S, CaO, MgO, SiO_2, Al_2O_3. Composition of iron, (3.5 to 4.2% C, varying amounts of Si, Mn, P, S) of slag and of waste gas obtained. 22 ref.
(D8n, RM-q, *Mn,* Fe)

530-D.* (German.) **Electrometallurgy of Steel.** Franz Sommer. *VDI Zeitschrift,* v. 100, Aug. 1, 1958, p. 1053-1062.

Directly and indirectly heated electric arc furnaces, low-frequency and middle-frequency induction furnaces and resistance furnaces. Required properties of scrap; melting processes; refining; elimination of harmful gases such as carbon monoxide, hydrogen, nitrogen.
(D5, D6; ST)

531-D.* (Russian.) **Equilibrium of the Distribution of Sulphur Between Metal and Slag in the Openhearth Furnace.** L. A. Shvartsman, A. I. Osipov, V. F. Surov, M. L. Sazonov, S. A. Telesov and A. M. Ofengenden. *Doklady Akademii Nauk SSSR,* v. 120, no. 3, 1958, p. 599-601.

Sulphur distribution influenced by the ratio of basic and acid compounds contained in the slag. It is advised to decrease the silica in the slag, if possible, during the melting period, and to keep the slag liquid by adding liquefying materials including ferrous oxide.
(D2d, D11n, D11s; S)

532-D.* (Russian.) **Reduction of Iron Oxides Under High Pressure.** A. S. Tumarev and L. A. Panyushin. *Stal'*, v. 18, Sept. 1958, p. 769-776.

Influence of gas pressure on speed of reduction of iron oxides in blast furnace. Grain size of iron ore 1-4 mm., intermittent gas pressure at 1-3 atm. Increased gas pressure accelerates the reduction process of iron oxides by the carbon monoxide (in the kinetic zone). Use of high pressure in blast furnace increases speed and rate of indirect reduction. The higher the velocity of gas flow the greater the influence of gas pressure on the reduction process. (D1, 3-74)

533-D.* (Russian.) **New Designs for Cooling Blast Furnaces.** S. M. Andon'ev, G. A. Kudinov and O. V. Filip'ev. *Stal'*, v. 18, Sept. 1958, p. 776-780.

Experiments conducted with 1033-cu. m. capacity blast furnace on use of a thin-walled furnace shaft with surface plate coolers; vertical plate coolers with cells for crust formation for the boshes; cooling devices of improved design for the lower part of blast furnace; tuyeres and furnace hearth bottom. (D1a, W10f, 1-52)

534-D.* (Russian.) **Advantages of Grading Blast Furnace Burden Materials.** M. A. Shapavalov. *Stal'*, v. 18, Sept. 1958, p. 780-781.

Sifting out of iron ore fines below 6 mm. and grading of ores is most effective means of eliminating the peripheral-axial gas flow, reducing coke consumption and increasing blast furnace productivity. 4 ref. (D1a)

535-D.* (Russian.) **Investigation of Thermal Performance of 500-Ton Openhearth Furnace.** V. S. Kocho, V. I. Grankovskii and E. A. Ploshchenko. *Stal'*, v. 18, Sept. 1958, p. 782-788.

Determination of distribution of heat flow along length of bath, when injecting compressed air into furnace ports. This has made possible determination of optimum thermal conditions for heats. Tests made in basic furnaces with Cr-Mg roofs that had withstood 450 heats. The specific heat consumption for a 500-ton furnace averaged 125 kg. per ton of steel and average length of melt 12.4 hr. 5 ref. (D2h)

536-D.* (Russian.) **Desulphurization of Basic Converter Steel by Top Blowing With Oxygen.** S. I. Lifshits. *Stal'*, v. 18, Sept. 1958, p. 788-793.

Steel made in converter with 20 cu. m. capacity lined with magnesite chromite brick. Oxygen use under 10-14 atm. pressure is from 56.3 to 62.3 cu. m. per ton of steel. Composition of oxygen blown pig is: 0.5% Si, 1.8% Mn, 0.09% P and 0.08% S. Satisfactory results in desulphurization of oxygen-blown converter steel can be obtained only when sulphur content in iron does not exceed 0.07%. To obtain steel from pig containing more than 0.05% sulphur, special melting methods have to be applied. (D11n, D3b)

537-D.* (Russian.) **Melting Stainless Steel From Scrap With Use of Silico-Manganese.** L. I. Teder, V. Ya. Monastyrskii and V. I. Mesyats. *Stal'*, v. 18, Sept. 1958, p. 801-802.

How to reduce cost of stainless steel production. Ferro-alloys constitute 61.5% of steel and their replacement with cheaper substitutes is major goal in cost reduction. Replacement of metallic Mn by silico-manganese under certain conditions does not increase carbon content and results in considerable savings in consumption of low-carbon ferrochromium and ferrosilicon. (D9r; SS, RM-p, AD-n31, Mn)

538-D. Application of Oxygen to Openhearth Furnaces. W. Gerling and K. O. Zimmer. *Iron and Coal Trades Review*, v. 177, Sept. 26, 1958, p. 725-728. (From *Stahl und Eisen*, v. 78, Feb. 6, 1958, p. 156-160.)

Previously abstracted from original; see item 125-D, 1958. (D2g; ST)

539-D. Ferromanganese: the Spice of Steel. *Engineer and Foundryman*, v. 23, July 1958, p. 35-37.

Latest types of smelting plant at Cato Ridge, Natal, South Africa. (D5; ST, Mn, AD-n31)

540-D. Does Moisture Control Benefit Blast Furnace Air? C. E. Agnew. *Iron Age*, v. 182, Nov. 6, 1958, p. 114-117.

Examination of opposing theories of drying blast furnace air or adding controlled amounts of moisture. (D1h)

541-D. Extension of the LD Process. Pt. 1. Production of Special Steels. O. Cuscoleca and K. Rosner. *Iron and Coal Trades Review*, v. 177, Aug. 22, 1958, p. 441-448.

Adaptation of the process permits high-carbon and various grades

of alloy steel to be produced. 7 ref. (D10a)

542-D. Extension of the LD Process. Pt. 2. Conversion of High-Phosphorus Iron. *Iron and Coal Trades Review,* v. 177, Aug. 29, 1958, p. 501-507.

Application of process to conversion of irons containing from 0.5 to 1.5% P if a double-slag method of operation is adopted. The second slag formed can be re-used as a first slag on the next heat, and, to tap metal cleanly from under this slag, a special taphole is incorporated in the vessel. 7 ref. (D10a; RM-q)

543-D. Modern Steelmaking Practice. *Iron and Coal Trades Review,* v. 177, Sept. 5, 1958, p. 569-574.

Steelmaking by the duplex process, slag control in the openhearth, role of immersion pyrometry in steel refining, use of basic roofs, were discussed at the 12th Junior Steelmaking Conference of BISRA at L'landudno on June 4th and 5th. (D2, D3, X9r; RM-h38)

544-D. Conversion of Low-Phosphorus Iron. H. Kosmider, A. Weyel and H. Neuhaus. *Iron and Coal Trades Review,* v. 177, Sept. 19, 1958, p. 667-673.

Oxygen-steam "mixed blast" bottom blown converter can be adapted to convert low-phosphorus irons previously unusable. 11 ref. (D3a;RM-n)

Distribution of slag-forming materials in the furnace during the scrap and scrap-ore processes. Significance of the slag in dephosphorization, decarburization and desulphurization and influence on hydrogen content. 119 ref. (D2d, D11n, D11q; RM-q)

563-D. Tula Sverdlosk, Chelyabinsk, Magnitogorsk — Key Russian Steel Plants. Nicholas J. Grant and John Chipman. *Journal of Metals,* v. 10, Mar. 1958, p. 182-185.

Equipment and layout; vacuum ingot degassing and blast furnace practice. (D1, D8m)

564-D. Alloyed Steel in the Ukraine. David Swan. *Journal of Metals,* v. 10, Mar. 1958, p. 185-186.

Electric arc furnace practice. 4 ref. (D5)

565-D. Vacuum Treatment of Steel in the Soviet Union. A. M. Samarin. *Journal of Metals,* v. 10, Mar. 1958, p. 190-192.

4 ref. (D8m)

566-D. Consumable-Electrode Vacuum Arc Melting. Helmut Gruber. *Journal of Metals,* v. 10, Mar. 1958, p. 193-198.

Furnace design; arc control; skull melting and pairing. 17 ref. (D8m)

567-D. New Developments in Steelmaking Processes. D. L. McBride. *Journal of Metals,* v. 10, Apr. 1958, p. 263-267.

Use of oxygen in blast furnace, openhearth and Bessemer converters. 7 ref. (D1h, D2g, D3b)

568-D. Humidified Blast Furnace Operation. Richard J. Wilson. *Journal of Metals,* v. 10, Apr. 1958, p. 268-271.

Operating characteristics of No. 5 blast furnace at Indiana Harbor with higher blast temperatures and added moisture. Benefits attributed to the use of steam were improvement in hearth temperature control and increase in drying rate of the furnace. 4 ref. (D1h, 2-62)

569-D. Carbon Monoxide Reduction of Iron Ore. Otto Stelling. *Journal of Metals,* v. 10, Apr. 1958, p. 290-295.

In a fluidized bed with cementite as the main component traversed by carbon monoxide of relatively high concentration, concentrates are introduced at a temperature below 700° C. After cooling to 300° C. the product is heated to 750° C. or more, and a very rapid reaction takes place with subsequent sintering and formation of metallic iron. (D8j, B15)

570-D. Hot-Metal Pre-Treating Tower. J. M. Gaines and D. C. Hilty. *Journal of Metals,* v. 10, July 1958, p. 452-455.

Subdivision of the iron into small drops in an atmosphere and use of a shot tower. Practically all Si was removed, and C reduced to 2% or less. (D8n)

571-D. Unconventional Iron Smelting Processes. M. O. Holowaty and C. M. Squarcy. *Journal of Metals,* v. 10, July 1958, p. 456-459.

Elliptical blast furnace, direct reduction processes, vertical retort processes, rotary hearth processes and rotating kiln.
(D-general, A2; Fe)

572-D. R-N Direct Reduction Process. Alex Stewart and H. K. Work. *Journal of Metals,* v. 10, July 1958, p. 460-464.

Ore and solid carbonaceous fuel are fed into a rotary kiln at several times the rate of the carbon requirement. Limestone and dolomitic limestone are fed into the kiln to arrest the sulphur in the ore and fuel. As the ore travels through the kiln, countercurrent to the flow of heat, it is dried, preheated and reduced. The product is metallic iron suitable for electric furnace or openhearth feed after compacting. (D8j)

573-D. Vacuum Casting of Steel. J. N. Hornak and M. A. Orehoski. *Journal of Metals,* v. 10, July 1958, p. 471-475.

Vacuum-casting process successfully reduced hydrogen concentration in steels for large forging sections to a level at which the steel is insensitive to flanking. The final hydrogen content of the steel is at a level at which the tensile ductility for aged and unaged specimens is approximately the same. The pressures at which the process is conducted require that special detailed attention be given to the preparation of the equipment and the actual vacuum casting of the steel. (D9s, 1-73; H)

574-D. Thermochemistry of Oxygen Steel. W. O. Philbrook. *Journal of Metals,* v. 10, July 1958, p. 477-482.

Production of steel of low nitrogen content with increased scrap consumption. 20 ref. (D10, P12)

575-D. Exothermic Ferromanganese. W. R. Lewis, R. L. Kimberly, T. V. Wainwright and W. A. Olsen. *Journal of Metals,* v. 10, Sept. 1958, p. 611-614.

Production, results and influence of exothermic practice.
(D-general, C21d; AD-n31, Fe, Mn)

15-E. (German.) **Selection of Alloys for Die Casting.** W. Wolf. *Metall,* v. 11, Aug. 1957, p. 655-659.

The founder wants suitability for casting while the user looks for good mechanical properties, high accuracy and good surface finish. Zn, Al and Cu alloys constitute a compromise.
(E13; Zn, Al, Cu)

16-E. (Russian.) **Alloying and Modification of Heat Resisting Silicon Cast Iron.** P. I. Durasov and N. N. Aleksandrov. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 42-48.

All samples showed tendency to develop cracks except Si iron with spheroidal graphite alloyed with Mn. 8 ref. (E21; CI-r, *Si*)

17-E. (Russian.) **Horizontal, Centrifugal Casting Machine.** E. M. Petrov and M. T. Evdokimov. *Vestnik Mashinostroeniya,* v. 37, Aug. 1957, p. 33-36.

Design and characteristics of new machine which can handle castings 1000 mm. in diameter, 3500 mm. long and 10-100 mm. thick. (E14, 1-52)

18-E. **How Precision Toolmaking Affects Shell-Molding Success.** Otto W. Winter. *American Machinist,* v. 101, Oct. 21, 1957, p. 139-142.

Special precautions in the cooling of patterns and core boxes for shell molding to counteract thermal effects, mold spreading, collapse or distortion and to provide for gating and stripping. (E19c)

19-E.* **Effect of Aluminium on the Inoculating Power of Ferrosilicon and Its Tendency to Give Pinholing.** J. V. Dawson. *British Cast Iron Research Association Journal of Research and Development,* v. 7, Aug. 1957, p. 2-9.

Effects of varying amounts of Al in ferrosilicon used as an inoculant in nodular graphite cast iron; effects of Al content on inoculating power, pinholing, mechanical properties and eutectic cell count.
(E25q; AD-h, AD-p36, Fe, Si, Al, CI-r)

20-E.* **Preliminary Study of the Mode of Solidification of Chill Test Casting.** I. C. H. Hughes. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Aug. 1957, p. 10-22.

Theoretical aspects of chill and mottle formation for sand and chill test castings; analysis of cooling curves and temperature distributions in solidifying cast iron. Effects of pouring temperature upon chill; formation of mottle and the characteristics of chill test fracture. 6 ref.
(E22r, E25n; CI)

21-E.* **A Note on the Influence of Furnace Holding Time on Chill and Mottle Formation.** J. Rickard. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Aug. 1957, p. 23-26.

Effects of pouring temperature, superheating temperature and furnace holding time on the depth of chill and mottle in chilled cast iron.
(E22r; CI)

22-E.* **Application of Sodium Silicates for Bonding Sands.** F. W. Nield and D. Epstein. *British Foundryman,* v. 50, Sept. 1957, p. 457-465.

Bond produced by passing carbon dioxide through test pieces of silicate sand containing as bonding agents sodium silicate with ratio of silicon dioxide to sodium oxide of 2.0, 2.5, 2.9 or 3.3; relationships between compression strength and gassing time, temperature and bonding solids. 4 ref. (E18n)

23-E.* **Improvements in Surface Finish, Inspection, and Fettling of Grey-Iron Castings.** L. Clarke. *British Foundryman,* v. 50, Nov. 1957, p. 539-551.

Design, patterns, sands, gating additions, washes, shot-blasting and controlled heat treatment; inspection of castings, gaging, hardness testing, crack detection and gamma ray tests; reduced fettling, standard gating and feeding methods.
(E11, S general; CI-n)

24-E.* **Some Observations on Cupola Tapping.** F. D. Roper. *British Foundryman,* v. 50, Nov. 1957, p. 553-556.

Operations entailed in intermittent tapping from cupolas. The tap-hole; its preparation, size, material used; shape of the tap-hole and its in-

fluence on actual tapping operations. Botting materials and the technique of botting-up. (E10a, 1-52)

25-E. Operating Experience With a Hot-Blast Cupola Plant. J. J. Sheehan and G. J. Shaw. *British Foundryman,* v. 50, Nov. 1957, p. 556-562.

Design of plant; recuperator, instrumentation; principles of operation; operating performance; melting rate; metal control; cork and fluxes; metal structure and labor requirements. (E10a, W18d)

26-E.* Effect of Design Variables Upon Shrinkage Defects Under Bosses on Thin Plates. A. G. Fuller. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Oct. 1957, p. 54-67.

Effect of variation in plate thickness, boss size, "gating ratio", and the position of the sprue relative to the casting, upon sinking beneath bosses on thin plates. Results on the basis of metal flow and temperature conditions within the casting. Sinking increases when conditions are such that the heat content of the metal filling the mold is increased. 8 ref. (E22; CI)

27-E.* Inverse Greyness in Malleable Cast Iron. C. T. Moore. *British Cast Iron Research Association, Journal of Research and Development,* v. 15, Dec. 1957, p. 68-79.

Preliminary investigation of inverse grayness occurring in certain types of commercially produced blackheart malleable castings, factors affecting the incidence of this defect in thin sections attached to a relatively heavier section of a test casting. Inverse grayness was found to increase simultaneously with mottle in the heavy section when the Al, Si, C or Mn content was increased. High casting temperatures and an increase in the thickness of the thin section also aggravated the defect. 3 ref. (E25q; CI-s)

28-E.* Carbon Pick-Up in the Cupola. Michael Perch and Charles C. Russell. *Foundry,* v. 85, Dec. 1957, p. 70-75.

Ash value of coke, or its major constituent, Si, has a significant inhibiting effect on C solubility in Fe. The type of Fe also seems to be important to the amount of C pick-up. 10 ref. (E10a; RM-j43)

29-E. Mold-Metal Interface Reactions. Howard F. Taylor and José Navarro. *Foundry,* v. 85, Dec. 1957, p. 76-80.

Theory for interface control which is basic enough to explain observed phenomena in the fields of investment casting, conventional sand mold processes and metal oxidation. 10 ref. (E11, E15, E19, M27F)

30-E.* Shrinkage in Tin Bronze Castings. Clyde L. Frear. *Foundry,* v. 85, Dec. 1957, p. 81-85.

Behavior of Sn bronzes; causes of defects such as cavities, shrinkage and leakages; solidification characteristics; types of dendrites, formation. 3 ref. (To be continued.) (E25n; Cu-s, *Sn,* 9-68)

31-E.* How to Make Epoxy Patterns and Coreboxes. Joseph W. Tierney. *Foundry,* v. 85, Dec. 1957, p. 86-90.

Epoxy plastic tooling technique is a duplicating process. The mold usually is of plaster or of epoxy material, made from a pattern or model of the part. From this mold, many epoxy patterns or coreboxes can be made in a fraction of time otherwise required to make a duplicate pattern. (E17, E21; NM-d)

32-E. "Slagging" of Cupolas. *Foundry Trade Journal,* v. 103, Oct. 31, 1957, p. 513-515.

Slag handling and disposal. (E10a; RM-q)

33-E. Czech Foundry Developments. Further Research in CO_2 Practice. *Foundry Trade Journal,* v. 103, Oct. 31, 1957, p. 518-520.

Abstracts of three articles contained in a booklet entitled "Progressive Methods in the Foundry" issued by the Czech Research Institute for Materials and Technology. (E18)

34-E.* Plaster Moulding of Beryllium Bronze. Louis Grand. *Foundry Trade Journal,* v. 103, Nov. 14, 1957, p. 573-576.

Benefits desired from substituting plaster for molding sand are improved surface finish, enabling the impression to be polished without machining and filing; and an increase in the fineness of pattern detail due to the low thermal conductivity of plaster. (E16a; Cu, *Be*)

35-E. Systematic Control Guides Production of High Quality Gray Iron Castings. A. W. Schneble. *Industrial Heating,* v. 24, Sept. 1957, p. 1860-1872.

Sand preparation and handling; control in molding and coremaking, melting practice control. (E11, E18; CI-n)

36-E. Manufacture and Use of Large Aluminum Die Castings. D. A. Bauer. *Machinery (London),* v. 91, Sept. 27, 1957, p. 757-762.

(E13; Al, ST)

37-E. Design of Die-Castings. Pt. 4. Determination of Tolerances. H. K. Barton. *Metal Industry,* v. 91, Nov. 15, 1957, p. 419, 424.

(E13, 17-51)

38-E. Cast Titanium and Zirconium Parts. S. M. Shelton. *Precision Metal Molding,* v. 15, Nov. 1957, p. 48-49, 110-112. (CMA)

Castings are most successfully produced by consumable electrode vacuum melting and pouring into graphite molds. (E12, E10r; Ti, Zr, 5-63)

39-E. Investment Caster Uses Vacuum. *Steel,* v. 141, Nov. 25, 1957, p. 96-98.

Austenal Inc. uses Ni-base alloys for gas turbine blades on production line operation. (E15, 1-73; Ni)

40-E. Casts 150 Engine Blocks an Hour. *Steel,* v. 141, Dec. 2, 1957, p. 122-124.

Automated line at Pontiac's foundry built around two indexable molding machines. (E19, 1-52, 1-61; ST)

41-E. (Dutch.) **Visit to the Foundry Institutes in Denmark, Sweden and Norway.** Gieterij Centrum. *Gieterij-Centrum Berichten,* v. 5, Sept. 1957, p. 49-52.

Exchange of ideas and comparison of operational conditions. Comparative production figures, including Finland (which was not visited). The Technological Institute in Copenhagen has a training foundry supported by the industry. The Metal Institute in Stockholm pays much attention to synthetic sand. The Foundry Section of the Technological Institute in Oslo is in the beginning stage. (E general, A9)

42-E. (French.) **Core Racks.** J. Léonard. *La Fonderie Belge,* no. 10, Oct. 1957, p. 242-246.

List of defects caused by wrong arrangement of cores or by ignorance of properties of core racks; mechanical tests on racks. (E-21, W19g)

43-E. (German.) **Foundry Sand Testing.** Jules Kistler. *Giesserei Praxis,* v. 75, Oct. 10, 1957, p. 429-435.

Purpose; permeability; fineness; mechanical and physical properties; fire resistance; moisture content. (E18)

44-E. (Japanese.) **Gases in Cast Iron.** S. Ikeda, H. Iwanaga and Y. Ono. *Casting Institute of Japan, Journal,* v. 29, July 1957, p. 499-507.

Casting defects due to nitrogen in molten Fe; effect of K_3Fe (Cn)6, Fe_2O_3, SiO, Fe-Si and Al in molten iron. (E11; CI, *Si, Al*)

45-E. (Japanese.) **Influence of Height of Test Piece on Properties of Molding Sands.** Kenji Hashimoto. *Casting Institute of Japan, Journal,* v. 29, July 1957, p. 522-527.

Permeability is not influenced by the height, top hardness increases linearly; ramming energy necessary to mold a test piece increases proportionally by height, and compression strength is inversely proportional to height. (E18r)

46-E. (Japanese.) **Semi-Continuous Casting of Aluminum.** Shigeo Muromachi. *Light Metals,* v. 7, July 1957, p. 6-27.

Fundamental experiments on segregation in Al alloys; studies on semicontinuous casting. 45 ref. (E25n, C5q; Al)

47-E. (Japanese.) **Shrinkage Coefficent and Deformation of Die and Gravity Castings. Pt. 7.** Tomonobu Kanno and Torazo Uehara. *Light Metals,* v. 7, July 1957, p. 69-74.

Formula for production of castings with desired shape. (E13, E11, E25q; 5-61)

48-E. (Book-French.) **Metals and Process Alloys Used in Ferrous Metal Casting.** Prepared by Centre Technique des Industries de la Fonderie (Foundry Industries' Scientific Center). 106 p. 1957. Editions Techniques des Industries de la Fonderie, 12 Av. Raphael, Paris, (16e) France. 1800 F.

Handbook for founders. Principal metals and their applications, reasons for use of alloys, alloying equipment. Lists of French suppliers of raw materials for ferrous metal foundries. Appendix covers standard specifications used in U. S., chemical analyses, fusion ranges and densities of ferro-alloys, physical properties of principal metals, chapter on pearlite, characteristic diagrams. (E general; ST, CI)

49-E. Sands for Moulding. *Mechanical World and Engineering Record,* v. 137, Sept. 1957, p. 417-418.

Molding sand properties, their effect on the production of satisfactory cast parts; types of defects associated with unsuitable sands. (E18)

50-E. (German.) **Foundry Practice.** C. Stieler. *VDI Zeitschrift,* v. 99, Aug. 1957, p. 1195-1196.

Literature review. 19 ref. (E general)

51-E. (Italian.) **What Process Shall We Use for Core Making?** *Fonderia,* v. 6, Sept. 1957, p. 381-385.

Advantages and disadvantages of conventional, shell-molding and CO_2 processes, and of method involving use of self-drying binders. (E21g)

52-E.* (Italian.) **Carburization and Decarburization in Industrial Frequency Induction Furnaces.** Elio Calamari. *Fonderia Italiana,* v. 6, Oct. 1957, p. 403-406.

Operational details of carburization and decarburization of ferrous alloys during melting in laboratory and shop installations of low-frequency induction furnaces. (E10b, W18a; CI)

53-E. (Italian.) **Mechanization in Small Foundries.** *Fonderia,* v. 6, Oct. 1957, p. 425-430.

Goals and equipment for gradual mechanization. Mechanization in small foundries should be synonomous with organization of work and simplicity of installations; mechanization in Italian foundries does not necessarily mean the same thing qualitatively and quantitatively as in the more highly industrialized U. S. (E general, 18-74)

54-E. (Russian.) **Casting Tool Blanks in Shell Molds.** Ya. I. Briskin. *Stanki i Instrument,* v. 28, June 1957, p. 22-24.

(E19c)

55-E.* Factors Affecting the Surface Finish of Steel Castings. David V. Atterton. *Foundry,* v. 86, Jan. 1958, p. 78-83.

Research into burnt-on sand. The effective radius of the pores between sand grains varies widely in the foundry and depends on numerous factors, including fineness of the sand, its grading, binder content, degree of compaction, sintering temperature, presence of fusible materials such as metallic oxides, and mold and core dressings of a wide variety. 17 ref. (To be continued.) (E18r; ST)

56-E.* Shrinkage in Tin Bronze. Pt. 2. Clyde L. Frear. *Foundry,* v. 86, Jan. 1958, p. 84-88.

Dissolved gases in melts, with special reference to hydrogen; method of preventing gas pick-up; deoxidation practice. (To be continued.) (E25s; Cu-s, *Sn*)

57-E. Efficient Cupola Operation. T. H. Burke. *Foundry,* v. 86, Jan. 1958, p. 89-93.

Linings, coke, chill tests, fluxes, tuyeres, desulphurization, inoculation and factors affecting chill values. (E10a, W18d)

58-E.* Controlling the CO_2 Process. F. L. Turk, J. J. Gutwald and R. P. Lanz. *Foundry,* v. 86, Jan. 1958, p. 94-97.

Variables investigated include types of sand; proprietary sodium silicate binders; sand mixtures; gassing time; methods of mixing CO_2 sand; variations in carbon dioxide gas, and parting agents. (E18)

59-E. Permanent Mold Casting of Aluminum at the Maytag Co. C. B. Curtis. *Foundry,* v. 86, Jan. 1958, p. 98-102.

(E12, Al)

60-E. Recent Developments in the Manufacture of Castings. Pt. 1. J. L. Rice, R. W. Ruddle and P. A. Russell. *Foundry Trade Journal,* v. 103, Dec. 5, 1957, p. 665-672.

Post-war developments in established foundry practice and in the alloys used for castings. Present status of the various methods, mold production techniques, die-casting developments, shell-molding process. (E general)

61-E. Preview of Ford's New Works—Thames Foundry at Dagenham Nearing Completion. *Foundry Trade Journal,* v. 103, Dec. 5, 1957, p. 673-676.

(E general, 18-67)

62-E.* Recent Developments in the Manufacture of Castings. Pt. 2. J. L. Rice, R. W. Ruddle and P. A. Russell. *Foundry Trade Journal,* v. 103, Dec. 12, 1957, p. 693-702.

Nature and significance of the CO_2 process, precision investment castings, the Shaw process and other techniques. Review of alloy development with reference to gray, malleable irons and spheroidal graphite irons, Cu and Al alloys. (To be continued.) (E general; CI, Cu, Al)

63-E.* Application of Statistical Control in the Production of Precision Castings. V. diSambuy. *Foundry Trade Journal,* v. 103, Dec. 26, 1957, p. 753-756, 758.

Results of experiments carried out in Italian foundry. Standard deviations of the wax-injection and metal casting processes; problem of tolerances in investment castings. (E15, S12)

64-E. New Coring Method Broadens Uses of Light Metal Castings. John L. Everhart. *Materials in Design Engineering,* v. 46, Dec. 1957, p. 102-105.

Introduction of small-diameter intricate passages into sand-cast Mg and Al alloys. Proper design can result in savings in weight, space and machining time. (E21; Mg, Al)

65-E. Design of Die-Castings. Pt. 4. Determination of Tolerances. H. K. Barton. *Metal Industry,* v. 91, Nov. 8, 1957, p. 397-399.

(E13, 17-51, 17-55)

66-E. Design of Die-Castings. Pt. 5. Wall Thicknesses. H. K. Barton. *Metal Industry,* v. 91, Dec. 6, 1957, p. 477-480.

(To be continued.) (E13, 17-51)

67-E. (Dutch.) **Compressive Strength of Molding and Core-Sand With Waterglass as a Binder.** H. G. Levelink. *Metalen,* v. 12, Oct. 31, 1957, p. 406-412.

Strength is a function of time of CO_2 and air exposure. (E18n)

68-E. (German.) **Evaluation of Molding.** Hans Jungbluth. *Giesserei,* v. 44, Nov. 7, 1957, p. 681-694.

Break-up curves; ramming tests; sand triangle. 22 ref. (E18, E19)

69-E. (Japanese.) **Vacuum Melting of Various Pig Irons.** Isao Aoki and Tomojiro Tottori. *Casting Institute of Japan, Journal,* v. 29, Sept. 1957, p. 627-631.

Pig irons of different chemical composition showed accelerated precipitation of eutectic graphite, decrease in amounts of Mn, S, Cu and Sn. Graphite nodulization depends on composition. 5 ref. (E10b, 1-73; CI-a, CI-r)

70-E. (Japanese.) **Gasses in Cast Iron. Report No. 2.** Shigeru Ikeda, Hiroshi Iwanaga and Hiroshi Ono. *Casting Institute of Japan, Journal,* v. 29, Sept. 1957, p. 631-637.

Casting defects due to nitrogen in molten iron and the mechanism of their formation. 7 ref. (E25s, 9; CI)

71-E. (Japanese.) **Results of Fundamental Studies on Foundry Sand in Kawaguchi. Report No. 1.** Eüchi Matsumura. *Casting Institute of Japan, Journal,* v. 29, Sept. 1957, p. 643-648.

(E18)

72-E. (Japanese.) **Research on Cast Iron Treated With Calcium. Report No. 1. Effect on Molten Iron.** Masuteru Maruyama and Akira Watanabe. *Casting Institute of Japan, Journal,* v. 29, Oct. 1957, p. 694-702.

10 ref. (E25q; *Ca,* CI-r)

73-E. (Japanese.) **Study on Cupola Tuyeres. Report No. 3.** Kiyoshi Ishikawa, Ichiro Saeda and Toshio Suzuki. *Casting Institute of Japan, Journal,* v. 29, Oct. 1957, p. 702-707.

With projecting water-cooled tuyeres, blast pressure requirement is lowered, clogging tendency is reduced, and penetration is improved. 3 ref. (E10a, W18d)

74-E. (Japanese.) **Green Sand for Steel Casting. Report No. 5.** Hideo Mikashima and Toshiro Owadano. *Casting Institute of Japan, Journal,* v. 29, Oct. 1957, p. 711-715.

Color adsorption tests. 3 ref. (E18r)

75-E. (Japanese.) **Study on Silica Molding Sand. Report No. 2.** Umeji Harada and Keizo Nishiyama. *Casting Institute of Japan, Journal,* v. 29, Oct. 1957, p. 715-721.

Heating characteristics of four different foundry silica sands. 6 ref. (E18)

76-E. Methods Engineering, With Emphasis on Flow Process-Control Applied to Fettling Shops. F. Gaiger and R. Hancox. *British Foundryman,* v. 50, Dec. 1957, p. 589-596.

(E24, A5)

77-E.* Production of S. G. Iron by the Nickel-Magnesium Process. W. A. Potter. *British Foundryman,* v. 50, Dec. 1957, p. 597-601.

A high-carbon, low-phosphorus iron is essential and it is desirable that Mn and S should also be kept low. For the Mg process, the iron may be hypo or hypereutectic and the C equivalent value may thus lie over a wide range. Generally, the high-carbon irons are better, but in heavy castings there will be some segregation of the graphite spheroids if the iron is hypereutectic. (E25q; CI-r)

78-E.* Experiments on the Effect of Atmospheric Pressure on Top Feeding Heads. A. Pearson. *British*

Foundryman, v. 50, Dec. 1957, p. 601-604.

Experiments were designed to ascertain whether hot spots could be counteracted by the positive introduction of atmospheric pressure to the top feeding head, as many top heads freeze over, resulting in partial vacuum in the shrinkage cavity. All results were checked by radiography. Steel tested analyzed 0.17-0.020% C, 0.3-0.4% Si, 0.5-0.7% Mn. (E23, E25n; ST)

79-E.* Improved Technique for Determining the Porosity of Cast Specimens. R. W. Ruddle. *British Foundryman,* v. 50, Dec. 1957, p. 605-615.

Rapid and accurate porosity determinations both for research purposes and for analysis of melt quality in works control. Apparatus, testing procedure and method of computing results. 3 ref. (E25q, P10m, 1-53)

80-E. Application of the CO_2 Process in the Production of Steel Castings. I. Rees. *Foundry Trade Journal,* v. 103, Dec. 19, 1957, p. 723-726.

Practice at Glanmorfa Ltd. (E11, E18, W19g; ST)

81-E. Recent Developments in the Manufacture of Castings. Pt. 3. J. L. Rice, R. W. Ruddle and P. A. Russell. *Foundry Trade Journal,* v. 103, Dec. 19, 1957, p. 729-735.

Magnesium foundry practice. 100 ref. (E general; Mg)

82-E.* Magnesium Precision Castings Open New Production Potential. L. H. McCreery. *Light Metal Age,* v. 15, Dec. 1957, p. 28-30.

Patterns, molds, testing, inspection, drawing practices; suggestions for control from the foundryman's viewpoint. (E15; Mg)

83-E. Design of Die-Castings. Pt. 5. Wall Thicknesses. H. K. Barton. *Metal Industry,* v. 91, Dec. 13, 1957, p. 502-504.

(E13; 17-51)

84-E.* Die Casting. Gustav Lieby. *Modern Castings,* v. 32, Dec. 1957, p. 35-46.

Advantages, machines, alloys and their properties, die-casting design and alternative methods such as sand and permanent molds. (E13, 1-52)

85-E. Fiat. George W. Cannon, Sr. *Modern Castings,* v. 32, Dec. 1957, p. 47-49.

Foundry practice at the Fiat plant, Turin, Italy. (E general, T21)

86-E. Stop-Look-Listen Before You Try Shell Molding. Arthur Woods. *Modern Castings,* v. 32, Dec. 1957, p. 50-54.

European experiences in designing pattern plates, gating and risering, curing, joining, coremaking as well as stack molding. (E19c)

87-E. D Molds Make Precise Steel Castings. *Steel,* v. 141, Nov. 11, 1957, p. 110-113.

Dietert shell mold process used by a Texas foundry to produce carbon and low-alloy steel castings with close tolerances and smooth surfaces. (E16c; ST)

88-E. Precision Investment Cast Tensile Tests of Low Alloy Steel. J. F. Wallace and I. Berman. Watertown Arsenal. *U. S. Office of Technical Services,* PB 131120, Sept. 1949, 49 p. $1.25.

A precision investment casting technique for casting a sound, low-alloy, 357-in. diameter tensile steel bar capable of predicting the optimum properties of a heat of steel. (E15, Q27; AY)

89-E. (German.) **Iron Cores in East Germany.** Hermann Wesner and Wolfgang Probst. *Giessereitechnik,* v. 3, Aug. 1957, p. 169-172.

Raw material, coatings, manufacture, shapes and dimensions, storage and transportation, need of standards. 2 ref. (E21; CI)

90-E. (German.) **Surface Defects in Steel Castings.** Fritz Brunn. *Giessereitechnik,* v. 3, Aug. 1957, p. 172-173.

Molds made of suitable material eliminate defects in production. (E21; ST, 9-71)

91-E. (German.) **Proper Design for Castings.** Herbert Klotz. *Giessereitechnik,* v. 3, Aug. 1957, p. 174-178.

Comparative demonstration of old techniques versus new suggestions. (E general, 17-51)

92-E. (German.) **Suggestions to Improve Mold Accessory Equipment.** Heinz Lucas. *Giessereitechnik,* v. 3, Aug. 1957, p. 180-182.

Suitable ejector mechanism; clamping; steam lines; need of specifications. (E19, W19m, 1-52)

93-E. (German.) **Purpose and Effect of the Riser.** Werner Tenner. *Giessereitechnik,* v. 3, Aug. 1957, p. 186-188. (E22q)

96-E. (Russian.) **Production of Large, Cast Iron Machine Parts Using Forced Air Cooled Molds.** I. V. Mitichev, *Liteinoe Proizvodstvo,* no. 9, Sept. 1957, p. 11-16.
(E general, W19g; CI)

97-E. (Russian.) **Control and Adjustment of Basic Process of Cupola Melting.** N. L. Sobol. *Liteinoe Proizvodstvo,* no. 9, Sept. 1957, p. 16-19.
(E10a)

98-E. (Russian.) **Magnesium Modification of Pig Iron of Low Sulphur Content Melted in a Basic Cupola.** G. I. Kletskin. *Liteinoe Proizvodstvo,* no. 9, Sept. 1957, p. 21-26.

Method of introducing Mg into pig iron; influence of sulphur contents upon Mg addition effect; characteristics of the cupola and the basic lining; optimum conditions for basic melting. (E10a; CIa, Mg, AD-a)

99-E. (Russian.) **Experimental Application of Quick-Hardening Binding Materials to Fast Preparation of Casting Molds and Cores.** V. A. Sokolova. *Liteinoe Proizvodstvo,* no. 9, Sept. 1957, p. 26-30.

Application of water glass and special hardeners in sand technology. (E18n)

100-E. (Russian.) **Main Paths of Progress of Soviet Foundry Industry.** *Liteinoe Proizvodstvo,* no. 11, Nov. 1957, p. 1-4.
(E general)

101-E. (Russian.) **Operation of Furnaces With Regulated Selection of Gases Through Forehearth.** G. G. Shepel. *Liteinoe Proizvodstvo,* no. 11, Nov. 1957, p. 5-8.

Iron casting methods used in small foundries manufacturing spare parts, so as to enhance the alloying, antifriction and toughening qualities of product. (E10; CI)

102-E. (Russian.) **Densification of Ingot Molds Through Compression, Vibro-Compression and Vibration.** L. E. Komarov. *Liteinoe Proizvodstvo,* no. 11, Nov. 1957, p. 10-15.

Method is applicable to ingot molds of most varied dimensions and configurations. (E11, W19c, 17-57; CI)

103-E. Nonmetallic Inclusions in Magnesium Iron. A. E. Krivoschev and I. E. Lev. *Liteinoe Proizvodstvo,* no. 11, Nov. 1957, p. 18-20. (Henry Brutcher, Altadena, Calif., Translation no. 4094.)

Desulphurizing effect of Mg in cast iron.
(E general, 9-69; AD-a, *Mg,* CI)

104-E.* (Spanish.) **Production of Low-Carbon Steel Parts by the Shell Molding Process.** Jose M. Navarro and Howard F. Taylor. *Instituto del Hierro y del Acero,* v. 10, July-Sept. 1957, p. 253-277.

Influence of system of runners and sprues on surface defects in low-carbon steel parts; effect of chemical additions. Parts of 2.5 cm. section were found to be more sensitive to pouring speed and location of gates than parts of 1.25 cm. section. Addition of sodium, potassium and calcium carbonates to molds greatly improved surface quality of parts not thicker than 1.25 cm. Shell molds containing inorganic binders produced parts free of surface defects. 7 ref. (E19c, E22; 9-71; CN-g)

105-E. Shell Cores for High Production. *Canadian Metalworking,* v. 20, Nov. 1957, p. 37-38.

Introduction of plastic coated, blown shells, which provide an improved internal finish and detail of castings, is making baked solid cores obsolete for production runs.
(E19c, E21g)

106-E.* **Compressed-Air Risers.** D. R. Kononow. *Iron and Steel,* v. 30, Oct. 1957, p. 489-491.

Application of compressed air to riser feeding of steel and gray iron castings. Effects on casting yield, tensile properties, impact properties, elongation and reduction of area of castings; dimensions and pressure for risers.
(E22q, Q general, ST, CI-n)

107-E.* **Literature Review of Metal Penetration.** A. E. Murton and S. L. Gertsman. *Modern Castings,* v. 33, *American Foundrymen's Society, Preprint No. 58-12,* Jan. 1958, p. 37-42.

Five investigations of metal penetration into foundry molds and cores indicate that an absolute remedy has not been found but good foundry practices minimize the problem. 13 ref. (E11, E18)

108-E.* **Hot Deformation of Molding Sand.** H. W. Dietert and T. E. Barlow. *Modern Castings,* v. 33, *American Foundrymen's Society, Preprint No. 58-6,* Jan. 1958, p. 43-47.

Study of the deformation of sand as it is heated by molten metal.

Means of measuring hot deformation, the use of these measurements, methods for increasing rate of deformation. (E18r)

109-E. New Foundry Sand. Gilbert S. Schaller. *Modern Metals,* v. 13, Oct. 1957, p. 82-86.

Production of 85,000 castings per month from Alcan No. 135 and Alcan No. 236 Al alloys with molds of Northwest olivine. Advantages of olivine over silica as molding sands. (E18; Al)

110-E. (Russian.) **Progress and Perspective of Steel Casting Production in Heavy Machine Construction.** I. R. Kryanin and P. F. Vasilevskii. *Vestnik Mashinostroeniya,* v. 37, Dec. 1957, p. 28-32.

(E general; ST)

111-E.* Effect of the Size of K-Bar Test Castings on Their Shrinkage Defects. T. J. Szajda. *British Cast Iron Research Association, Journal of Research and Development,* v. 7, Dec. 1957, p. 110-128.

Influence of the size of K-bar test castings and of the pouring temperature in the range 1415 to 1470° C. upon the occurrence and location of a number of shrinkage defects. Maximum drawing occurred at a pouring temperature of about 1450° C. As the pouring temperature decreased over the range 1450 to 1415° C., draws were replaced by sinks. A criterion for estimating the severity of shrinkage defects on the basis of their location and frequency of occurrence at different positions in the test casting is also suggested. 4 ref. (E25n, 1-54; 9-68)

112-E. Foundry Industry in Sweden. Lars Villner. *Castings,* v. 3, Oct. 1957, p. 22-33.

(E general)

113-E. An Aluminum Casting With a Guarantee. *Design Engineering,* v. 3, Dec. 1957, p. 49.

New process which raises tensile strength to 38,000 psi., yield strength 27,000 psi. and elongation 5%, thus making possible many new uses for Al investment castings. (E15; Al)

114-E. Injection of Swarf Into the Cupola. S. H. Chrobok. *Engineer,* v. 22, Oct. 1957, p. 48-55.

Techniques for melting scrap. (E10a; CI, RM-p)

115-E. Forty Years in and Around Foundries. W. L. Hardy. *Foundry Trade Journal,* v. 104, Jan. 2, 1958, p. 3-10.

Critical assessment in which earlier methods of coremaking, molding, metal melting and pouring are summarized and compared with modern techniques. (E11)

116-E. Austenitic Manganese-Steel Technology in an Australian Foundry. Hedley Thomas. *Foundry Trade Journal,* v. 104, Jan. 2, 1958, p. 11-14.

Melting, pouring, molds and cores, heat treatment, chemical control, physical testing, metallography and methods of Mn determination. (E11, *Mn,* SS-e)

117-E. Ford's New Foundry. *Iron and Steel,* v. 31, Jan. 1958, p. 15-17.

Design of new "Thames" foundry at Dagenham, Essex, England. (E general, A5)

118-E. Die Casting Practice at the Works of Metal Castings, Ltd. *Machinery,* v. 91, Dec. 27, 1957, p. 1507-1516.

(E13)

119-E.* Review of Die Casting Practices Abroad. Donald L. Colwell. *Metal Progress,* v. 73, Jan. 1958, p. 88-90.

European Al die castings are made in proportionately higher tonnage than Zn; in both kinds the chemical specifications are higher than in America. Aluminum castings with silicon-free surfaces, capable of anodizing and coloring, are sought on both sides of the ocean. (E13; Al, Zn)

120-E. Precision Toolmaking Aids Shell-Molding. Otto W. Winter. *Metalworking Production,* v. 101, Nov. 29, 1957, p. 2133-2137.

Patterns and core boxes (thermodies) perform at 500° F. and perform a heat transfer function. (E19c, 2-61)

121-E. (French.) **Casting of Copper Alloys in Chill Molds.** Maurice Billing. *Fonderie,* v. 140, Sept. 1957, p. 391-397.

The casting of Cu alloys in chill molds results in lower costs, better dimensional accuracy and finer structure. Cu-Al alloys, brasses and tin bronzes are cast. The chill molds are made of pearlitic cast iron. Feeding of the mold and temperature of casting. Brass used in chill molds is cheap because purity is not too important. A Cu content of only 61% is necessary. Control of composition; difficulties and remedies. 10 ref. (E22r; Cu)

122-E. (French.) **Use and Preparation of Resin Pretreated Sand in Shell Molding.** A. Woods. *Fonderie Belge,* Nov. 1957, p. 269-273.

Advantage of resin; raw materials. (E19c, E18n; NM-d34)

123-E. (French.) **Description of Three Small Foundries for Gray Cast Iron. Pt. 2.** *Fonderie Belge,* Nov. 1957, p. 274-281, 290.

Description of the foundries; productivity; details of the processes used. (E general, 18-67; CI-n)

124-E. (French.) **Modernization of Foundries.** A. Plesinger. *Fonderie Belge,* Nov. 1957, p. 285-289.

Two factors of productivity are studied: substitution of manual work by mechanical operations and organization of molding areas. (To be continued.)

Effects of Ti on the cast structure solidified under various cooling conditions. 12 ref.
(E25n, N12, Al-a, *Ti)*

136-E. (Japanese.) **Study of Causes of Hydrogen Inclusion in Aluminum Using Deuterium as Tracer.** Yoshitsugu Mishima, Shizo Hirano, Naoaki Takahashi and Iichi Ogahara. *Light Metals (Tokyo),* v. 7, Nov. 1957, p. 16-20.

(E25s, 1-59; Al, *H)*

137-E. (Japanese.) **Effect of a Small Amount of Beryllium on Aluminum-Magnesium Alloys.** Toyoji Ushioda, Osamu Yoshimura and Shoichiro Mashiyama. *Light Metals (Tokyo),* v. 7, Nov. 1957, p. 29-33.

6 ref. (E25, 2-60; Al, *Be, Mg,* AD-p)

138-E. (Japanese.) **Improvement of Magnox Alloys Used for Canning Material in Carbon Dioxide Gas-Cooled Reactor.** Yoshitsugu Mishima and Naoaki Takahashi. *Light Metals (Tokyo),* v. 7, Nov. 1957, p. 68-72.

Mg-Al-Ca-Be alloys with varying amounts of Ca and Be were prepared and the effect of Ca and Be on the properties of the alloys confirmed. 5 ref.
(E25, T11, 2-60, 2-62; Al, Mg, *Ca, Be)*

139-E.* **Influence of Sulphur on the Castability, Tensile Properties, and Pressure Tightness of Sand-Cast Bronzes and Gunmetals.** H. Reiter.

British Foundryman, v. 51, Jan. 1958, p. 2-10.

Elementary sulphur was added to 85-5-5-5 and 80-10-2 gunmetals and 90-10 phosphor bronze from which D.T.D. bars, disks wtih inadequately fed bosses, and fluidity and castability test castings were cast in green-sand molds. A metal mold was used for comparing hot tearing characteristics. Results of this work showed that sulphur contents up to 0.3% had no deleterious effect on porosity, grain structure, tensile strength, and pressure tightness, or on the other properties examined. 15 ref.
(E25p, Q27a, 2-60, Q26q; Cu, *S*)

140-E.* Pressure or Diaphragm Moulding. Tom Barlow. *British Foundryman,* v. 51, Jan. 1958, p. 10-16.

Successful practice of pressure molding depends on the use of a sand of high strength and high flowability and the use of a diaphragm to apply high-pressure air through the whole of the sand area, resulting in a mold of high over-all density free from the packing variations associated with normal jolt-squeeze ramming. The time of the process is almost independent of the size of the mold so that the use of large boxes with a number of patterns in each box is encouraged. 10 ref.
(E19, E18r, 3-74)

141-E.* Surface Finish for Non-Ferrous Castings. *British Foundryman,* v. 51, Jan. 1958, p. 17-35.

Mold additions appear to have little influence on finish. Certain mold and core binders are shown to have a beneficial influence on finish, especially shell molding and CO_2 binders. To a certain extent the influence of binders on finish is a reflection of their influence on the flowability of the sand. Other variables that influence surface finish are alloy type, extent to which the sand has been used and pouring temperature, whereas pattern quality, venting, and green versus dry sand had no significant effect. 35 ref. (E18n, 9-71; EG-a 38)

142-E.* Use of Stearin Wax for Simulating Shrinkage Defects in Steel Castings. D. B. James and J. M. Middleton. *British Foundryman,* v. 51, Jan. 1958, p. 36-46.

Provided that the pouring temperature does not exceed 2° C. superheat, the freezing of pure stearin wax can give a useful guide to the distribution of shrinkage in plain carbon steels containing 0.2-0.3% C. Since the solidification shrinkage of stearin wax is greater than steel the analogy cannot be taken too far—castings fed to soundness in wax would be over-risered when made in steel. The successful use of the simulation technique is limited to quite small castings. 13 ref. (E25n, 9-68; CN)

143-E. Application of Quality Control to a Moulding-Sand System. L. A. Deaville. *Foundry Trade Journal,* v. 104, Jan. 9, 1958, p. 33-36.

Report of a two-year investigation to obtain a sand of known and consistent quality, permitting variation of sand properties at will. Result has been a general improvement in casting quality. (E18)

144-E. Pattern Details in Cast Iron. *Foundry Trade Journal,* v. 104, Jan. 9, 1958, p. 39-41.

Use of metal inserts for the larger types of wooden patterns and corebores; suitable materials and specific examples. (E17; CI)

145-E. Large Aluminium Die-Castings. A. F. Bauer. *Metal Industry,* v. 92, Jan. 10, 1958, p. 23-25.

Machine developments, die design and stress and pressure tests.
(E13, W19n, 17-51; Al)

146-E. (German.) **Microporosity in Sand and Chill Mold Castings of Magnesium Alloys.** Paul Spitaler. *Giesserei,* v. 44, Dec. 1957, p. 757-766.

14 ref. (E25q, 9-68; Mg, 5-60, 5-66)

147-E. (German.) **Testing the Hardness of Molding Sand.** Wolfram Ruff. *Giesserei,* v. 44, Dec. 1957, p. 766-769.

Avoiding difficulties in testing by modifying the spring in the test apparatus; conversion of hardness values into Brinell units. (E18r, Q29)

148-E. (German.) **Production of Nodular Cast Iron With Addition of Compounds.** Nurettin Cuhadar. *Istanbul Teknik Universitesi, Bulteni,* v. 10, no. 2, 1957, p. 28-38.

Possibility of replacing Mg, Ce and Ca with their compounds. 16 ref. (E25q; CI-r, *Mg, Ce, Ca*)

149-E. Gleason Works Achieves Newness in a Foundry. Robert H. Herrmann. *Foundry,* v. 86, Feb. 1958, p. 78-88.

Equipment, layout and procedures at the Gleason Works, Rochester, N. Y. (E general, 1-52, 18-67)

150-E.* Shrinkage in Tin Bronze. Clyde L. Frear. *Foundry,* v. 86, Feb. 1958, p. 92-97.

Effect, elimination and prevention of gas contaminants. (E25n, Cu-s, *Sn*)

151-E. Sodium-Silicate Bonded Steel Molds. P. J. Ahearn and G. I. Gartner. *Foundry,* v. 86, Feb. 1958, p. 98-101.

Use of sodium silicate, or waterglass, as a substitute for resin. (E19c; NM-f45)

152-E.* Manufacture and Use of Large Aluminum Die-Castings. Alfred F. Bauer. *Foundry,* v. 86, Feb. 1958, p. 102-106.

Present status of the die-casting process and outline of further application such as die cast V-8 engine blocks. (E13, 17-57; Al)

153-E. Surface Finish of Steel Castings. David V. Atterton. *Foundry,* v. 86, Feb. 1958, p. 107-111.

Sand fineness and grading, binder content, compaction, penetrating pressures, grain size, mold atmosphere, sand sintering and degree of ramming. (To be concluded.) (E18, E11; ST)

154-E. Forsterite Offers Advantages as Shell Mold Material. W. H. Owen. *Foundry,* v. 86, Feb. 1958, p. 134-137.

Suggested practice for preparing forsterite grains mix for shell molding of steel. (E19c; ST, NM-f45)

155-E. Casting Magnesium-Thorium Alloys. Thomas A. Dickinson. *Foundry,* v. 86, Feb. 1958, p. 156-158.

(E general; Mg, *Th*)

156-E.* Metallurgical Aspects of Hot-Tearing in Cast Steel. Kurt Beckius. *Foundry Trade Journal,* v. 104, Jan. 30, 1958, p. 115-123.

Results of casting experiments made in an apparatus designed on the resistance-spring principle. The resulting curves for time-contraction relationships were compared with the occurrence of tearing as manifested in macro-etched, tear-containing sections of cast test bars. The contraction-restraining load imposed on the specimens was removed at different time intervals after pouring, and data collected were further supplemented by temperature measurements during cooling and solidification. (E25n, Q26p; ST)

157-E. Why Bullard Prefers Gas Fuel in Most Modern Foundry. *Industrial Gas,* v. 36, Dec. 1957, p. 3-4.

Gas fuel is used for all heating operations except basic iron melting. (E general; CI, RM-m)

158-E. Handling Units Speed Foundry Cycle. *Iron Age,* v. 180, Dec. 5, 1957, p. 134-135.

Unit performs molding, closing and shaking-out operations without manual handling of flasks in foundry producing V-8 engine block castings. (E11, T21b, 18-74; CI)

159-E. How to Cut Costs on Patterns and Cores. R. B. Sinclair and W. N. Richards. *Iron Age,* v. 180, Dec. 12, 1957, p. 132-134.

Suggestions for simplifying and economizing in molding and coremaking and in pattern selection. (E17, E21g)

160-E. Production of F.H.P. Electric Motors. *Machinery,* v. 91, Nov. 22, 1957, p. 1184-1195.

Aluminum die casting, machining, welding and other operations in production of small electric motors. (E13, W11q, 17-57; Al)

161-E.* Heat Transfer From Die Casting Dies. H. K. Barton. *Machinery,* v. 91, Nov. 29, 1957, p. 1276-1283.

Nature and extent of heat input and heat losses in die casting Zn and Al. Requirements for water cooling, effect of variations in radiating surface and heat loss during interruptions in casting operations. Desirability of reducing thermal gradient; possibilities and requirements of high-temperature coolants. Thermal balance and question of die cavity surface temperature for production of sound castings. (E13, P11k; Zn, Al)

162-E. Cast Aluminum Products. *Modern Metals,* v. 13, Nov. 1957, p. 82-86, 90-92.

(E general; Al, 17-57)

163-E.* Heat Control in the Die Casting Process. A. F. Bauer. *Precision Metal Molding,* v. 16, Jan. 1958, p. 46-47.

Five places where heat must be controlled are the alloying room where metals are heated and superheated, the holding furnace, the dies, where heat exchange usually takes place, injection mechanism, and preheating inserts where they are used. (E13, A11e)

164-E. Prototypes That Show Casting Design Flaws. *Precision Metal Molding,* v. 16, Jan. 1958, p. 56-57.

Production of accurate die models; other services provided by a pattern and model shop. (E13, W19n, 17-51)

165-E. Moulding Characteristics of Jubbulpore Pale Grey Sand. U. C.

Sharma and B. R. Nijhawan. *Scientific and Industrial Research, Journal,* v. 16, Section A, Sept. 1957, p. 424-427.

(E18r)

166-E. Investment Caster Uses Vacuum. *Steel,* v. 141, Nov. 25, 1957, p. 96-98.

Details of melting cycle and mechanical properties of vacuum investment cast Ni-base alloys.
(E15, 1-73; Ni)

167-E. Carbon Arc Vs. Induction Melting. *Steel,* v. 142, Jan. 27, 1958, p. 74-76.

Comparison of techniques on the basis of part design, relative cost, control or reproducibility of results and versatility, from data compiled at a foundry using both methods for investment casting.
(E10r; E15, W18a, W18s, 17-53)

168-E. (French.) **Rational Modernization of Foundries.** Adolphe M. Plesinger. *Fonderie,* v. 142, Nov. 1957, p. 481-490.

Mechanization in Czechoslovakian foundries described by staff member of Institute for Foundry Research in Brno. 11 ref.
(E general, 18-74)

169-E.* (French.) **Study of the Possibilities of Making Pressure-Tight Castings in Light Alloys.** Louis Grand. *Fonderie,* v. 142, Nov. 1957, p. 491-498.

Oil tests under pressure on castings made of 20 Al alloys provide classification in order of increasing porosity, both before and after machining. Refining with Na or a flux that releases Na on contact with molten metal reduced porosity. A 5.6% Si, 3% Cu alloy was found best suited to production of parts studied. 4 ref. (E25r; Al, *Si, Cu,* RM-q)

170-E.* (French.) **Study of Cores Bonded With Sodium Silicate.** Maurice Decrop and Marcel Goguillon. *Fonderie,* no. 142, Nov. 1957, p. 499-515.

Cores bonded with sodium silicate withstand storage well in ordinary atmosphere but present stripping problems; sodium silicate binders and CO_2 process are best suited to production of medium and large-size cores. Graphs give compressive strength of cores of various compositions in all stages of preparation and use; cracking, blowholes, shrinkage, ease of stripping and breakdown analyzed in terms of binder composition, temperatures, atmospheres, influence of sodium silicate and CO_2. (E21, E18n)

171-E. (French.) **Contribution to the Study of Riser Systems in the Casting of Steel: Case of a Gear.** Marcel Jaumain. *Fonderie,* v. 143, Dec. 1957, p. 545-550.

Gear was cast with eight different pouring and riser combinations and castings examined for soundness. 5 ref. (E22q, T7a; ST)

172-E. (German.) **Special Brass Alloying Technique.** E. Brunhuber. *Giesserei-Praxis,* no. 24, Dec. 1957, p. 521-523.

Influence of single components (Al, Sn, Fe, Mn and Pb) on chemical and mechanical properties of special brass. (E25, 2-60; Cu-n, *Zn, Al, Fe, Mn, Pb, Sn*)

173-E. (German.) **Malleable Cast Iron With High Ductility.** A. Hohmann. *Giesserei-Praxis,* no. 24, Dec. 1957, p. 523-524.

Pressure casting in chill molds using graphite carbon. Best results are obtained with Cu content of 0.40-1.20%. (E22r; CI, *Cu,* AD-n32)

174-E. (German.) **Contribution to the Problem of Pinhole Formation in Steel Castings.** R. Radtke. *Giessereitechnik,* v. 8, Dec. 1957, p. 269-272.

Addition of FeO to melt produced pinholes; surface tension, which depends on oxygen content of melt, is important. Other causes.
(E25q, 9-68; ST)

175-E. (German.) **Riser Runner Method for Heavy Castings.** H. Giese. *Giessereitechnik,* v. 8, Dec. 1957, p. 279.

Casting technique demonstrated for 23-ton casting. (E22q; CI)

206-E.* **CO_2 Process Useful in Producing Experimental Castings.** R. L. Fehr and R. C. Harris. *Foundry,* v. 86, Mar. 1958, p. 80-82.

CO_2-hardened molds provided a convenient method of producing several experimental rigid fuse bodies at Frankford Arsenal. (E19; NM-f45)

207-E. Cast Epoxy Core Driers for Dielectric Ovens. John M. Leaman and Phillips L. Morrison. *Foundry,* v. 86, Mar. 1958, p. 85-87.

Inexpensive cast epoxy driers developed for use with contoured sand cores cured in dielectric ovens provide required thermal and dielectric properties and are made easily and economically. (E21)

208-E.* **Effect of Grain Size on Physical Properties of Synthetic Molding Sand.** Carl E. Schubert. *Foundry,* v. 86, Mar. 1958, p. 88-91.

Tests on silica sands with various average grain sizes but with clay and moisture held constant indicate that green permeability decreases with finer sands, green compressive strength remains constant and dry compressive strength increases with finer sands. (E18r)

209-E.* **Surface Finish of Steel Castings.** David V. Atterton. *Foundry,* v. 86, Mar. 1958, p. 92-95.

Depth of molten metal penetration through sand pores controls the amount of burnt-on sand that has

to be cleaned from a casting. The limit of penetration is defined by the location in the sand of the isothermal corresponding to the solidification temperature of the metal. Location of this isothermal is determined entirely by thermal factors such as thermal diffusivity of the sand and temperature of the metal-mold interface. Surface finish produced by new techniques such as chamotte molding. 8 ref.

223-E. (French.) **Pouring Design for the Production of Cast Iron Propellers.** *Journal d'Informations Techniques des Industries de la Fonderie,* no. 92, Nov-Dec. 1957, p. 3-4.

Shrinkage holes in area where blades join boss in heavy propeller castings (over 175 lb.) were eliminated by system of top pouring with ten pencil gates, sprues being removable from body of casting after

machining with graving tool or nylon grinding wheel. (E22p, T22h; CI)

224-E. (French.) **Fabrication of Parts in Malleable Cast Iron.** *Journal d'Informations Techniques des Industries de la Fonderie,* no. 92, Nov-Dec. 1957, p. 5.

Tests to determine optimum conditions for casting circular plates from 2 to 3 meters in diameter, with 25 by 45-mm. panels on one face. Particular requirement was Brinell hardness of between 120 and 150 in finished casting. Exclusive use of hematite pig of given composition produced desired results. (E25; CI-s)

225-E. (French.) **Casting of Gear Cases in Light Alloy.** *Journal d'Informations Techniques des Industries de la Fonderie,* no. 92, Nov-Dec. 1957, p. 9-11.

Details of pattern and gating design; use of chills. 3200 pieces were produced, with only one reject. (E17, E22p, E22r, EG-a39)

226-E. (German.) **Casting of Steel With Nitrogen as Protective Gas.** Paul Holtzhaussen and Hans Fiedler. *Neue Hütte,* v. 2, Nov. 1957, p. 685-691.

233-E. (German.) **Casting Production and Defect Report. Productivity Determination and Quantitative Control.** Presented by the Collective Organization of the "Hüttenverein" Foundries. *Giessereitechnik,* v. 3, Nov. 1957, p. 244-248.

(E-general)

234-E. (German.) **Development of Pressure Casting.** V. von Reimer. *Werkstatt und Betrieb,* v. 91, Jan. 1958, p. 21-24.

Machines, die-cast Al parts, pressure casting forms and alloys. (E13, 3-74; Al)

235-E.* (Japanese.) **Influence of Tellurium on Cast Iron Containing Titanium.** Tohei Ototani and Yoichi Tokunaga. *Casting Institute of Japan, Journal,* v. 29, Dec. 1957, p. 831-837.

Fe-C-Si alloys containing 0.2% Ti were remelted in graphite crucible in kryptol furnace. Up to critical amount of Te addition, graphite structure changes, due to difference in growth rate of austenite and graphite in solidification, 0.003-0.005% Te changing eutectic graphite to coarse flakes. Ferrite matrix is formed around fine graphite with excess Te and hardness is decreased. 9 ref. (E25q, 2-60; CI-q, *Te, Ti*)

236-E.* (Japanese.) **Structural Changes of Cast Iron Caused by Melting in Contact With Various Oxides.** Masao Honma. *Casting Institute of Japan, Journal,* v. 29, Dec. 1957, p. 837-845.

Influence of oxides in the refractories. In argon and carbon monoxide atmosphere flake graphite structure becomes finer as influenced by SiO_2, MgO, BaO and CaO, in that order. With Al_2O_3 there is no change. Sulphur content is reduced in similar order. Deoxidation and desulphurization in argon atmosphere. In CO atmosphere changes in graphite structure are due to changes of sulphur content of alloys. 11 ref. (E25q, 2-66; CI)

237-E. (Japanese.) **Study of Binding Clays.** Ryojiro Kono and Ichiyu Imao. *Casting Institute of Japan, Journal,* v. 29, Dec. 1957, p. 853-858.

Influence of clay impurities and minerals on green compressive strength of foundry sands. 3 ref. (E18n, 3-69)

238-E.* (Japanese.) **Studies of Foundry Silica Sands. Pt. 3.** Umeji Harada

and Keizo Nishiyama. *Casting Institute of Japan, Journal,* v. 29, Dec. 1957, p. 858-871.

Study of refractory properties of Tokai district silica sands by shock heating. Refractory quality in following order; synthetic silica sand, conical sand, natural sand, beach sand. 9 ref. (E18r)

239-E. Precision Pressure Casting. *Australasian Manufacturer,* v. 42, Dec. 14, 1957, p. 44-46.
(E15, 3-74)

240-E. Swelling of Wood Patterns. Lars Lange. *Foundry Trade Journal,* v. 104, Feb. 13, 1958, p. 175-177.

Analysis of the mechanism of swelling and shrinkage. Consequences of such action and preventive measures. (E17, W19j)

241-E. Canadian Hot-Blast Water-Cooled Cupola. Pt. 2. J. E. Rehder. *Foundry Trade Journal,* v. 104, Feb. 13, 1958, p. 184-185.

Experience indicates that banking this furnace overnight is more economical than dropping the bottom each night, contrary to original expectations. (E10a, W18d)

242-E. Process Charts Applied to Foundry Operations. F. Gaiger. *Foundry Trade Journal,* v. 104, Feb. 20, 1958, p. 203-209.
(E-general, A5)

243-E.* An Instrument for Measuring the Gas Content of Aluminium Alloys During Melting and Casting. C. E. Ransley, D. E. J. Talbot and H. C. Barlow. *Institute of Metals, Journal,* v. 86, Jan. 1958, p. 212-219.

The parameter to be measured is the internal pressure of hydrogen in the melt. The instrument depends on the circulation of a small stream of nitrogen through the metal. The volume of gas circulated must be kept very small (2-3 cc. S.T.P.) and a special pump, valves and analysis Katharometer were developed. Probable use for other metals. 6 ref. (E5m, 1-53; Al)

244-E.* Molding Characteristics of Allahabad Sand. U. C. Sharma, R. M. Krishnan and B. R. Nijhawan. *Journal of Scientific and Industrial Research,* v. 16A, Nov. 1957, p. 517-522.

Sand tests included chemical analysis, mechanical grading, high-temperature tests and examination of molding properties. Molding characteristics of unwashed sand bonded with 5% Bihar bentonite and mixtures of washed sand with bentonite dextrine, Kordek, linseed oil and silica flour were evaluated. (E18r, E19)

245-E. Molding Characteristics of Hardware Sand. B. V. Somayajulu and B. R. Nijhawan. *Journal of Scientific and Industrial Research,* v. 16A, Dec. 1957, p. 566-570.
(E18r, E19)

246-E. Stainless Castings With Unusual Hot Strength. Carl Tylka. *Materials in Design Engineering,* v. 47, Mar. 1958, p. 104-105.

Close control of solidification rate yields cast valves and fittings exceeding ASTM strength specifications. In large fittings, use of castings instead of forgings results in cost reduction of up to 40%.
(E25n, Q27a, 2-62; SS, 5-60)

247-E. Profitable Companions. Shell Cores and Green Sand Molds. Frank K. Shallenberger. *Modern Castings,* v. 33, Mar. 1958, p. 32-33.

The use of shell cores in conjunction with shell, permanent, or green sand molds offers substantial savings in material, labor and equipment. (E19a, E19c)

248-E. Good Practices With Better Refractories for Best Ladle Lining. J. H. Rickey, Jr. *Modern Castings,* v. 33, Mar. 1958, p. 35-38, 120-121.

Casting quality is greatly affected by ladle refractories.
(E23, W19b; RM-h)

249-E.* Risering of Gray Iron Castings. J. F. Wallace and E. B. Evans. *Modern Castings,* v. 33, Mar. 1958, p. 39-45.

A recommended procedure based on available data and original calculations. 35 ref. (E22q; CI-n)

250-E.* Some Structural Considerations in Nodular Iron. Verne Pulsifer. *Modern Castings,* v. 33, Mar. 1958, p. 46-48.

Solidification process; proposal that nodules form near the liquidus in a normal nucleation process rather than near or below the solidus. Studies of rapidly chilled shot support this thesis. Mechanism and structures resulting from formation of magnesium sulphide.
(E25q, N2; CI-r)

251-E.* Correlation of Green Strength, Dry Strength and Mold Hardness of Molding Sands. R. W. Heine, E. H. King and J. S. Schumacher. *Modern Castings,* v. 33, Mar. 1958, p. 49-58.

Experiments to correlate green and dry strength with mold hardness. Effects of moisture content and clay type and amount. (E18r, E19)

252-E.* Deoxidation Practice for Copper Shell-Molded Castings. R. C. Harris. *Modern Castings,* v. 33, Mar. 1958, p. 59-63.

Embrittlement of Cu shell-molded castings results from decomposition of the phenolic resin used in the shell mold, causing the "steam reaction". Of four deoxidizers examined, Ti and Li proved effective. Gas-fired and 20,000 cps. induction equipment were found suitable for melting pure Cu. 6 ref. (E16c, E10; Cu)

253-E.* Mold Surface Behavior. Dan Roberts and Earl E. Woodliff. *Modern Castings,* v. 33, Mar. 1958, p. 64-70.

A simple low-cost device to examine rate and amount of mold expansion during pouring. The effect of variables such as moisture content, clay content and grain distribution is predictable; thus expansion can be kept within allowable limits. (E19)

254-E.* Evaluation of Shell Molding Process Capability. W. C. Truckenmiller, C. R. Baker and G. H. Bascom. *Modern Castings,* v. 33, Mar. 1958, p. 71-76.

Procedures, specific results and conclusions from investigations for the evaluation of dimensional control capabilities of the shell process. Sampling procedures for the development of critical pattern dimensions. (E16c)

255-E.* Induction Melting in a Magnesium Sand Foundry. J. G. House and M. E. Brooks. *Modern Castings,* v. 33, Mar. 1958, p. 77-80.

Melting in a line-frequency induction furnace. Various types of foundry scrap, as well as primary Mg, were melted and the operating characteristics compared with those of a gas-fired filter-type furnace. (E10r, W18a; Mg, RM-p)

256-E.* Investigation of the Hardening of Sodium Silicate Bonded Sand. Carl E. Wulff. *Modern Castings,* v. 33, Mar. 1958, p. 81-85.

Effects of CO_2, evaporation hardening, nitrogen, setting time, 3% binder, thermal hardening and temperature on the tensile strength of silica sand. 5 ref. (E18r)

257-E.* Fundamental Studies on Effects of Solution Treatment, Iron Content, and Chilling of Sand Cast Aluminum-Copper Alloy. E. M. Passmore, M. C. Flemings and H. F. Taylor. *Modern Castings,* v. 33, Mar. 1958, p. 86-93.

Solution treatment temperatures and times greater than those normally employed result in substantial improvement of mechanical properties of Al-Cu sand castings. Reduction of iron content below 0.24% also improved properties significantly. (E22r, J27a, Q-general, 2-60; Al, *Cu*)

258-E. High-Integrity Aluminum Castings. A. R. Mead. *Product Engineering,* v. 29, Feb. 17, 1958, p. 69-71.

(E-general, Q-general; Al)

259-E.* Development of Casting Techniques for Uranium and Uranium Alloys. George E. Jaynes, James M. Taub and Denton T. Doll. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 1-15.

Shapes ranging from 1 to 1800 kg. cast in vacuum induction furnaces with either micarta tube or steel tank construction. Use of graphite coated with ceramic as material for crucibles and molds. Application of uncooled induction coils, induction stirring and use of castable refractories, glass and copper as mold materials.
(E10, 1-69, 1-73, 1-52, W19g; U)

260-E.* Centrifugal Casting of U-Zr Alloy Rods. Arthur B. Shuck. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 39-50.

Design, development and experimental evaluation of multiple mold centrifugal casting machine with precision copper molds used in connection with high-vacuum induction heated melting and pouring to produce fuel rods or slugs from uranium alloy with 2% Zr. 6 ref.
(E14, E10, 1-69, 1-73, T11g; U, *Zr*)

261-E.* Induction Melting of Uranium Base Alloys. Neill J. Carson, Jr. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 23-29.

Vacuum induction melting, alloying and casting of uranium, U-Cb, U-Zr, U-Mo, U-Cr, U-Si and U-Al. Use of coated graphite and other materials as crucibles and molds. (E10, 1-69, 1-73, W18h, W19g; U)

262-E.* Injection Casting of Uranium-Fissium Alloy Pins. F. L. Yaggee, J. E. Ayer and H. F. Jelinek. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 51-62.

Injection casting apparatus. Mechanical and physical properties of pins cast from artificially formulated uranium-base fissium alloys. 4 ref. (E16, 1-52, Q-general, P-general, T11q; U)

263-E. (German.) Production of Manganese Bronze. F. Paschke. *Gies-*

serei-Praxis, no. 3, Feb. 10, 1958, p. 45-47.

(E-general; Cu-s, *Mn*)

264-E. (German.) **Slag Strainer Sprue and Its Benefits.** W. Pischl. *Giesserei-Praxis,* no. 3, Feb. 10, 1958, p. 48-50.

Construction of slag strainer sprue must be adapted to each type of casting. Its use results in reduction of inclusions by 35-40%. (E22; 9-69)

265-E. (German.) **Influence of Calcium-Silicon on the Casting of Steel.** Friedrich Lindenbeck. *Giesserei-Praxis,* no. 4, Feb. 25, 1958, p. 74-75.

(E-general, A4)

276-E. Shell Molding . . . Ten Years of Progress. *Foundry,* v. 86, Apr. 1958, p. 80-85.

Share of market achieved by shell moldings. (E16c, A4p)

277-E. Suppliers Discuss Developments in Resins and Molding Equipment. *Foundry,* v. 86, Apr. 1958, p. 86-89.

Suggestions for more efficient use of foundry resins. (E16c; NM-f45)

278-E. How Five Foundries Use Shell Molding. Robert H. Herrmann and Jack C. Miske. *Foundry,* v, 86, Apr. 1958, p. 93-103.

Experience of Albion Malleable Iron Co., Bendix Aviation Corp., Engineering Castings Inc., M. A. Harrison Mfg. Co. and Midwest Foundry Co. in the shell mold casting of gray iron, steel, brass and malleble iron. (E16c)

279-E. Shell Pattern Equipment Must Meet High Standards. Ray Olson. *Foundry,* v. 86, Apr. 1958, p. 104-106.

Shell molding patterns are difficult to design, tougher to make, expensive to buy. Basic requirements of shell patterns together with the problems involved. (E16c, E17)

280-E. Controlling Variables in Processing Shell Molding Sands. Jack E. Bolt. *Foundry,* v. 86, Apr. 1958, p. 107-109.

Results of tests at the Foundry Resin Laboratory, General Electric Co., concerning effects of certain variables on properties of resin-coated sand for shell molding. (E18r, E19c)

281-E. Diecasting Foundry Makes Automotive Hardware Parts. Robert H. Herrmann. *Foundry,* v. 86, Apr. 1958, p. 110-113.

Modern Al and Zn die-casting facilities and automatic equipment for machining, buffing and plating are included in new Ford plant for producing automotive hardware. (E13, T21c; Al, Zn, 5-61)

282-E.* Problems in Making Stainless Steel Castings. Ernest A. Schoefer. *Foundry,* v. 86, Apr. 1958, p. 114-119.

Problems encountered by producers of high-alloy castings made of Fe-Cr and Fe-Cr-Ni alloys to resist heat or corrosion. Table indicates standard designations and chemical composition ranges for heat and corrosion resistant castings. (E11; SS)

283-E.* Factors Affecting Carbon Pick-Up in the Cupola. Michael Perch and Charles C. Russell. *Foundry Trade Journal,* v. 104, Mar. 13, 1958, p. 291-296.

Carbon solubility of various foundry cokes. Inverse correlation between solubility and ash content. Effects of Si and Mn content, coking time, and other variables. 9 ref. (E10a; CI, RM-j43)

284-E.* Influence of Blast Input, Coke Size and Melting Coke Ratios on Cupola Performance. Pt. 1. F. Danis and M. Decrop. *Foundry Trade Journal,* v. 104, Mar. 20, 1958, p. 319-326.

Detailed analysis of the effect of amount of coke, blast input and coke size on thermal efficiency of cupola, temperature and production of iron. (E10a; CI)

285-E. Influence of Blast Input, Coke Size and Melting Coke Ratios on Cupola Performance. Pt. 2. F. Danis and M. Decrop. *Foundry Trade Journal,* v. 104, Mar. 27, 1958, p. 351-358.

(Concluded.) (E10a)

286-E.* Gases in Cast Iron With Special Reference to Pickup of Hydrogen in Sand Molds. An Account of Recent Work and the Views of British Investigators. J. V. Dawson and L. W. L. Smith. *Modern Castings,* v. 33, Feb. 1958, p. 39-51.

Effects of gases, various alloying elements and components of sand molds on porosity of cast iron. (E25q; CI, 9-68)

287-E.* Observations on Pinhole Defects in White Iron Castings. R. W. Heine. *Modern Castings,* v. 33, Feb. 1958, p. 53-57.

Slag formation during cooling of the molten metal is a major cause of pinhole defects in white iron castings. Four identifiable types are observed: reaction pinholes, aspiration pinholes and bubbles, evolution pinholes, miscellaneous (isolated pinholes). Relation to the variable conditions of gating, pouring, sand and molding practices. (E11; CI-p, 9-69)

288-E.* Theoretical Concepts of the Packing of Small Particles. J. B. Caine and C. E. McQuiston. *Modern Castings,* v. 33, Feb. 1958, p. 58-61.

A mathematical analysis of the effects of particle size distribution on the packing configuration and density of foundry sands. (E18r)

289-E. Density of Sand Grain Fractions of the AFS Sieve Analysis. R. W. Heine and T. W. Seaton. *Modern Castings,* v. 33, Feb. 1958, p. 62-67.

Effects of fineness, impurities, geometric shape and jolting energy on the density of compacted silica sand grains. (E18r)

290-E. Controlled-Slag Hot-Blast Cupola. D. Fleming. *Modern Castings,* v. 33, Apr. 1958, p. 47-58.

14 ref. (E10a, W18d)

291-E. Purchase Specifications for Commonly Used Steel Foundry Mold and Core Sand Binders. E. G. Vogel. *Modern Castings,* v. 33, Apr. 1958, p. 59-62.

(E18n; NM-F45)

292-E.* Effect of Pressure During Solidification on Microporosity in Aluminum Alloys. S. Z. Uram, M. C. Flemings and H. F. Taylor. *Modern Castings,* v. 33, Apr. 1958, p. 63-68.

Aluminum alloys 356 and 195 were solidified under pressures varying

from atmospheric (15 psi.) to 16.7 times atmospheric (250 psi.) Pressures greater than atmospheric were found to result in a substantial reduction of microporosity in sand cast test specimens. The test castings were adequately risered and the alloys thoroughly degassed. (E25q, 3-74; 9-68, Al)

293-E.* **Foundry Characteristics of a Rammed Graphitic Mold Material for Casting Titanium.** H. W. Antes, J. T. Norton and R. E. Edelman. *Modern Castings,* v. 33, Apr. 1958, p. 69-76.

Surface finish, shrinkage, compressive strength, permeability and thermal conductivity of an expendable graphitic mold. Amount of surface contamination of Ti cast into this type of mold. All of the variables were studied as functions of the molding pressure and moisture content of the graphitic material. 5 ref. (E19, W19g; Ti, NM-k36)

294-E.* **Some Requirements for Successful Fluidity Testing.** S. A. Prussin and G. R. Fitterer. *Modern Castings,* v. 33, Apr. 1958, p. 77-84.

A new fluidity tester (fluidimeter) is designed to insure reproducible metal flow. Techniques to determine the actual rate of flow of the molten metal stream within the fluidity test mold. (E25p, 1-53)

295-E.* **Investment Castings Go Civilian.** *Steel,* Mar. 3, 1958, p. 95-98.

Manufacturers producing intricate and hard-to-fabricate parts can now look for help from investment castings, due to cutbacks in aircraft programs. Although investment castings are expensive, this process offers many offsetting advantages, such as design freedom and a reduction in secondary operations. (E15)

296-E.* **Automatic Metering of Magnesium Opens Cold Chamber Die Casting Applications and Markets.** F. C. Bennett. Paper from "Magnesium in Perspective", Magnesium Association, p. 201-203.

Automatic supply of molten Mg alloy to cold chamber die-casting machines permits production rates equal to hot chamber Zn or Mg machines. Simple, safe, flexible process produces good quality castings. (E13; Mg)

297-E. **Magnesium Precision Castings Open New Production Potential.** L. H. McCreery. Paper from "Magnesium in Perspective", Magnesium Association, p. 601-610.

Castings with dimensional tolerances of ± 1/64 in., draft angle of 0 to 1° and wall thickness of 0.100 in. are produced, requiring little machining. These are lighter and less expensive than conventional castings requiring considerable machining and finishing work. (E15; Mg)

298-E.* **Some Aspects of Control of Quality of Magnesium Alloy Castings.** P. A. Fisher. Paper from "Magnesium in Perspective", Magnesium Association, p. 801-805.

While test results on samples may be valid, these results may or may not reflect the actual characteristics of the piece in service. Quality control must be based on a knowledge of the conditions under which the tested item will be used. (E-general, S21, S12; Mg)

299 E.* **Cored Passages Open New Applications to Magnesium Castings.** John L. Everhart. Paper from "Magnesium in Perspective", Magnesium Association, p. 1201-1208.

Unlined passages as small as ⅛ in. diameter, or of noncircular cross-section, can be produced. High complex arrangements with curve radii of 2½ to 3 in. permit nonturbulent fluid flow. These internal passages simplify design and maintenance, reduce costs. (E21; Mg)

Blown moist air at 1000° C. oxidized and increased chill tendency, total oxides, silica content and formed shrinkage cavities at 1400° C., no appreciable oxidation. High-temperature coke not changed. More moisture observed in cupola. (E10a; CI)

309-E.* (Japanese.) **Effect of Titanium on Cast Iron Properties in Cupola Melting.** Shigeyuki Hamada. *Casting Institute of Japan, Journal,* v. 29, Nov. 1957, p. 781-790.

With more than 0.17% Ti, eutectic structures of graphite appear. Dendritic austenite is observed in the microstructure with ferrite and pearlite in matrix although carbon and silicon contents are high. Higher mechanical properties are found than in ordinary cast iron. Supercooling occurs with high Ti content. 7 ref. (E25q, E10a, 2-60; CI, *Ti*)

310-E.* (Japanese.) **Properties of Shell Cores Made by Blowing.** Kaoru Kato. *Japan Foundrymen's Society, Journal,* v. 30, Jan. 1958, p. 19-24.

Most suitable air pressure is about 4 kg. per sq. cm. Shells of resin-coated sand containing only 2.5% resin have sufficient bending strength. Permeability of the shells is decreased. For 4% resin-coated sand, limited value of apparent density is 1.53 g. per cc. and value of porosity is 39.4%; for 2.5% resin content, values are 1.48 g. per cc. and 42.4% respectively. (E21, E19c; NM-f45)

311-E.* (Japanese.) **Efficiency of the Carbon Dioxide Process in Coremaking.** Yukio Kido and Jinichi Minamimura. *Japan Foundrymen's Society, Journal,* v. 30, Jan. 1958, p. 24-29.

Relationship between quantity and rate of carbon dioxide absorption and strength of hardened sand. Commercial binders and water glass were used. Amount of CO_2 absorbed is less than 0.7% of sand mixture. Better strength is obtained with 0.35% absorption. Amount of gas needed for hardening is 0.6-0.87% of the sand mixture. There is no advantage in mixing air with CO_2. (E18n, E21)

337-E. **Control of Die-Casting Machines.** *Metal Industry*, v. 92, Mar. 28, 1958, p. 247-251.

(E13, 1-52)

338-E.* (German.) **Casting Properties of Aluminum-Silicon Alloys.** R. Kummerle. *Metall*, v. 11, Oct. 1957, p. 848-854.

Important part of the Si-Al phase diagram up to 25% Si is investigated as to casting properties. The flow properties largely depend upon the behavior at transition from the liquid to the solid state. A spiral-type mold was used for determining the solidification process. For certain sponge-type characteristics two explanations are offered: (1) Al develops dendritic primary crystals, which tend to interlock; (2) the crystallization heat of Si is higher than of Al, slowing down the crystallization process. 18 ref.
(E25n, E25p; Al-b, *Si*)

339-E. (German.) **Copper-Lead Alloys. Pt. 3. The Specific Volume of Solid and Liquid Alloys and Volume During Solidification.** E. Pelzel. *Metall*, v. 11, Nov. 1957, p. 954-958.

Various alloys (including Cu-Pb-Ni) are observed as to their behavior during the solidification process. The specific volume varies considerably from liquid to solid depending on the phase diagram; pipe, cavities, porosity and segregation can be explained from these variations and the corresponding expansion and contraction. Materials were investigated with 70 to 85% Pb, 15 to 80% Cu, and 30 to 50% CuNi. 8 ref.
(E25n, P10d; Cu-b, *Pb, Ni*)

428-E.* Ductile High Strength Titanium Castings by Induction Melting. J. Zotos, P. J. Ahearn and H. M. Green. *Modern Castings,* v. 33, May 1958, p. 127-132.

Tests indicate that scrap Ti can be reprocessed by induction melting and still exhibit desirable engineering characteristics that make it a useful foundry alloy. 22 ref. (E10, 1-69; Ti, RM-p)

429-E.* Occurrence and Elimination of Leakage in a Gun Metal Casting. Marvin Glassenberg, Alfred H. Hesse and William H. Baer. *Modern Castings,* v. 33, May 1958, p. 133-139.

To overcome porosity of gun metal castings, chills of the same material and a specially designed ring-type gating system are used. (E22p, E22r; Cu-b, 9-68)

430-E. Foundry Practice for Sand Casting Commercially Pure Aluminum. Robert V. Scalco and Moss V. Davis. *Modern Castings,* v. 33, May 1958, p. 140-142.

(E11; Al-a)

431-E.* (French.) Aspects of Automation in the Foundry. Jacques Le Covec. *Fonderie,* v. 146, Mar. 1958, p. 105-112.

Presuppositions of automation: mass production, standardizing of single operations and specialization of workers. Examples of automation in cupola furnace process, sand preparation and molding, trimming and heat treatment. Advantages of automatic processes. (E11, 18-74)

432-E. (French.) Aging of Core Sand With Dextrin. Method of Testing Dextrin for Foundry Purpose. Claude Konlein. *Fonderie,* v. 146, Mar. 1958, p. 113-118.

Behavior in drying and in forming of molding sand compound kept for some time in hermetically closed containers. Examination of molding dextrin by testing its solubility and rotative ability. Best dextrin must have a solubility between 45 and 70% and a rotative ability of 140-150°. (E18r)

433-E.* (French.) Economical Method of Nodular Cast Iron Production by Treatment of Liquid Melt With Iron-Silicon-Magnesium Alloy. Nicolas Volianik. *Fonderie,* v. 146, Mar. 1958, p. 119-135.

History of use of Mg in cast iron. Outline of modern processes. Experimental technique using Fe-Si-Mg alloy and specially designed apparatus. Improvement in quality of cast iron. (E25q; CI-r; *Mg*)

434-E. (French.) Casting With Carbon Dioxide. *Journal d'Informations Techniques des Industries de la Fonderie,* No. 94, Mar. 1958, p. 5-9.

Evaluation of advantages and disadvantages of the CO_2 method of hardening sand cores with sodium silicate binder. (E18n)

435-E. (German.) **Production of Large Castings for Heavy Machines in the Soviet Union.** P. F. Wassilewski. *Giesserei,* v. 45, Apr. 10, 1958, p. 193-197.

(E-general; ST)

436-E.* (German.) **Unusual Casting Defects.** Walter Goschel. *Giessereitechnik,* v. 4, Feb. 1958, p. 37-40.

Gas bubbles causing blowholes may originate through the use of 55-mm. diameter cores instead of 60-mm. Large parts with thick walls may become defective if the molding sand becomes heated, expands and presses on fixed cores. (E11, E25, 9-68)

437-E. (German.) **Savings in Materials Using Spheroidal Pressure Riser.** Karl Heinz Meinecke. *Giessereitechnik,* v. 4, Mar. 1958, p. 49-53.

Construction of closed ball-shaped pressure riser possessing chalk-core for increase of pressure and a tangential entrance. Decrease of scrap as compared with usual riser. (E22q)

438-E.* (German.) **Segregation in Gray Cast Iron Chill Castings.** Wolfgang Gaude. *Giessereitechnik,* v. 4, Mar. 1958, p. 58-59.

Appearance and prevention of droplets (segregation) on castings. Mechanism of this type of segregation. (E22r, 9-69; CI-n)

439-E.* (German.) **Use of Separating Cores in Steel Casting.** Friedrich Dubielzig. *Giessereitechnik,* v. 4, Mar. 1958, p. 62-65.

Use of cores for easy separation of risers. Composition of core mixtures for green sand and dry casting. Forming of cores and molding technique. Applications. (E19, E21; ST)

440-E. (Italian.) **Possibilities of Reducing Fabrication Costs in Small Foundries.** Giuseppe Barchiesi. *Fonderia,* v. 7, Jan. 1958, p. 3-9.

(E-general, A4s)

441-E. (Italian.) **Computation of the Surface Area of a Sand.** Rinaldo Cattaneo. *Fonderia,* v. 7, Feb. 1958, p. 91-95.

(E18r)

442-E. Scrap Castings Caused by Hard Spots. H. Reininger. *Foundry Trade Journal,* v. 104, May 15, 1958, p. 573-578.

Undesirable hard spots and edges in castings may be reduced by careful control of C and Si content, using cementite-free pig, removing Cr and V impurities and redesigning mold to eliminate or reinforce fins and air vents. (E11, 9-71; CI, *Cr, Si, V*)

443-E.* **Casting Ferrous Metals in Anodized Molds.** Lester D. LaMotte. *Precision Metal Molding,* v. 16, Mar. 1958, p. 46-48.

Problems of permanent mold casting minimized by development of the Parlanti mold. It is anodized cast Al, designed to give the most desirable rate of heat transfer so that the mold surfaces are not destroyed by overheating and the casting has the best internal structure. (E12; 17-57, Al)

444-E.* **Designing for Aluminum Permanent Mold Casting. Pt. 1. Alloy Selection.** P. R. Kalischer. *Precision Metal Molding,* v. 16, Mar. 1958, p. 51-53.

Nominal compositions and equivalent specifications; mechanical properties; comparative ratings in castings, application, and service; typical physical properties of Al permanent mold alloys. (E12, Q-general, P-general, 17-51; Al)

445-E. Basic Hot Blast Cupola in the Integrated Steelworks. Heinz Voigt. *Stahl und Eisen,* v. 78, Mar. 6, 1958, p. 284-291. (Iron and Steel Institute Translation no. 902.)

Previously abstracted from original. See item 306-E, 1958. (E10a, 1-65, A4s; ST)

446-E. (German.) **Casting Properties of the Stanniferous Cast Copper Alloys.** Wilhelm Patterson. *Giesserei,* v. 45, Apr. 24, 1958, p. 220-228.

17 ref. (E25; Cu-b, *Sn*)

447-E. (German.) **High-Pressure Casting Dies and Equipment for the Production of Centrally Gated Die Castings on Horizontal Chamber Die Casting Machines.** Walter Bovensmann. *Giesserei,* v. 45, Apr. 1958, p. 244-247.

(E13, E22p, 1-52)

448-E.* (German.) **Grain Refinement of Aluminum and Its Alloys.** Elfriede Dittrich. *Neue Hutte,* v. 3, Feb. 1958, p. 93-101.

Movement, casting and superheating temperatures, as well as cooling velocity and small-scale inoculations with Ti, B, Zr, V, Cb, Mo and W, investigated. Both Ti and B seem

to be particularly advantageous for grain refining. 19 ref. (E25q; Al)

449-E. (Italian.) **Chill Casting of Light Alloys.** Biagio Caliri. *Revista di Meccanica,* v. 9, Mar. 1, 1958, p. 9-16.

(E22r; Al, Mg, Li)

450-E.* (Portuguese.) **Cast Iron Pistons.** Alberto A. Arantes, Cyro Guimaraes and L. A. Lacerda Santos. *ABM, Boletim da Associacao Brasileira de Metais,* v. 14, Jan. 1958, p. 5-18.

Composition of Brazilian raw materials, pouring techniques, mold design and addition elements analyzed for influence on casting defects, mechanical properties, microstructure of pistons. In spite of high phosphorous content of Brazilian pig, structures compare favorably with those of foreign-made pistons. Low sulphur content of some pig was found to impede formation of lamellar graphite. 8 ref. (E11, T21b, 17-57; CI)

451-E.* (Portuguese.) **Molding Sands Agglomerated With Wet Clays as Compared to Dry Clays.** Victor Lo Re. *ABM, Boletim da Associacao Brasileira de Metais,* v. 14, Jan. 1958, p. 53-62.

Wet clay obtained from source near place where study was conducted (cost therefore being a fraction of that of dry clay) provided greater compression strength and AFS hardness than same clay in powder form or a commercial powdered clay. Tests were made on damp as well as dried samples of mixtures. (E18r)

452-E. (Russian.) **Drying of Cores in a High-Frequency Electrical Field.** Yu. P. Basin. *Liteinoe Proizvodstvo,* v. 2, Feb. 1958, p. 7-10.

Among the advantages of high-frequency drying of casting cores are a decrease in the heat expenditure and very favorable conditions for automation of the process. (E21h, 1-69)

453-E.* (Russian.) **Linear Changes of Ceramic Molds in Heating and Cooling.** O. V. Stupishina. *Liteinoe Proizvodstvo,* v. 2, Feb. 1958, p. 20-23.

Addition of fireclay powder lowers the linear expansion by 2.5 times and of fused quartz by 6 times. A ceramic based on silicate suspension with waterglass as bond and with fireclay powder prevents sharp linear changes during heat treatment. Expansion and contraction curves obtained with optical dilatometer and precision furnace with maximum heating temperature of 1000° C. (E19)

454-E. (Russian.) **Melting 18 KHNVA Steel in an Arc Furnace.** V. K. Petrov, A. P. Kopeikin and E. D. Mokhir. *Stal',* v. 18, Apr. 1958, p. 326-330.

(E10r, W18s; ST)

455-E. (Swedish.) **Casting Defects and Their Causes.** J. Drachmann. *Gjuteriet,* v. 48, Apr. 1958, p. 49-55.

4 ref. (E25q, 9-68)

456-E. (Swedish.) **Design of Castings With Regard to the Fettling Operations.** Alrik Ostberg. *Gjuteriet,* v. 48, Apr. 1958, p. 56-59.

(E25q, E22p, E22q, 17-51)

457-E. Cavity Proportions Upon Metal Flow. *Australasian Manufacturer,* v. 42, Oct. 5, 1957, p. 44-50, 67, 68.

Control of metal flow in die casting by correct choice of the sprue, runner and gate and varying orientation of cavity in respect to the gate. (E13, E22)

458-E. Vacuum Die Casting Processes. *Australasian Manufacturer,* v. 42, Oct. 19, 1957, p. 70-79.

(E13, 1-73)

459-E. Some Aspects of Mold-Making. A. E. Peace. *British Foundryman,* v. 51, May 1958, p. 239-241.

Presidential address given before the Institute of British Foundrymen. 9 ref. (E19)

460-E.* Mold and Core Production by the CO_2 Process at the Blakeborough Foundries. T. C. Wilson and J. B. Hollis. *British Foundryman,* v. 51, May 1958, p. 241-250.

Sand mixes, effects of various additives, blacking methods, gassing equipment and methods; application to various types of molds and cores, examples; analyses of labor and material costs. (E19, E21, E18)

461-E.* Inverse Chill in Grey Cast Iron. G. T. Brown and R. T. Allsop. *British Foundryman,* v. 51, May 1958, p. 251-256.

Inverse chill showed the features of acicular carbide and undercooled-type graphite which have been previously reported. Inverse chill is produced by the interaction of a number of factors. In the present case the high sulphur:manganese ratio is considered to be primarily responsible for the stabilization of white iron. 15 ref. (E25n; CI-n)

462-E.* The Production of the British Motor Corporation Series "C" Cylinder-Head Casting. L. W. Bolton. *British Foundryman,* v. 51, May 1958, p. 257-265.

Molding and core-making; examination and gaging of cores. The metal is cupola melted; tests used to control its properties; special gaging and checking operations. (E11; CI)

463-E. Improvement and Probable Trends in Non-Ferrous Melting and Casting. James R. Hunt. *Castings,* v. 4, Mar. 1958, p. 5-19.

(To be continued.) 19 ref. (E10, W18, C5; EG-a38)

464-E. The Foundry Industry in Finland. *Castings,* v. 4, Mar. 1958, p. 19-23.

(E-general)

465-E. Recent Developments in the Manufacture of Castings. J. L. Rice, R. W. Ruddle and P. A. Russell. *Chartered Mechanical Engineer,* v. 4, Nov. 1957, p. 444-446.

Developments during last decade in foundry practice; shell molding, CO_2 process, Shaw process, nodular cast iron, new casting alloys. (E-general)

466-E. Light Alloys for Casting Tricky Shapes. *Design Engineering,* v. 4, May 1958, p. 58-59.

Trade-named Tens-50 new Al alloy can be cast with minimum rejection rates by sand or permanent mold methods. (E11, E12; Al-b)

467-E.* Risering of Steel Castings With Exothermic Sleeves. H. F. Bishop, H. F. Taylor and R. G. Powell. *Foundry,* v. 86, June 1958, p. 54-59.

Use of exothermic sleeves in risers permits reduction in riser diameter and volume as well as a longer solidification time for molten steel. (E22q; ST)

468-E.* Die Castings in Ammunition Design. L. G. Klinker, Morris A. Gardepe and Robert H. Ridgway. *Foundry,* v. 86, June 1958, p. 60-61.

Small ammunition parts fabricated by Zn die casting, Al die casting or permanent mold casting of iron. (E13, E12, T2j; Al, CI, Zn, Fe)

469-E. Foundry Modernization. Pt. 3. Robert H. Herrmann. *Foundry,* v. 86, June 1958, p. 62-64.

General Electric Co. facility for permanent mold production of gray cast iron; cupola, pattern shop, quality control. (E12, W18c, W19j)

470-E. Institute of Metals Jubilee Meeting. Works Visits: J. Stone and Co. (Charlton) Ltd. R. J. M. Payne. *Metal Industry,* v. 92, May 16, 1958, p. 403-405.

(E-general, 1-52; Al, Mg, 5-60, 18-67)

471-E. Idea Tour of European Foundries. C. A. Sanders. *Modern Castings,* v. 33, June 1958, p. 38-41.

Summary of developments in general foundry practice, sand handling, automation, CO_2 molding and pattern design. (E-general)

472-E.* Rigging Design of High Strength Magnesium Alloy Castings. Merton C. Flemings, Richard W. Strachan, Ernest J. Poirier and Howard F. Taylor. *Modern Castings,* v. 33, June 1958, p. 45-50.

Production of two high-quality Mg alloy sand castings. One casting was composed of relatively heavy sections (½ to 2 in. thick) and the other of thin sections (1/10 to ½ in. thick). Chilling substantially improved the properties of the heavy section casting in both AZ91C and AZ92A alloys. Chilling had little effect on the mechanical properties of the thin section casting. (E22r; Mg-b)

473-E. Sintered Alumina Molds for Investment Casting of Steels. F. C. Quigley and B. Bovarnick. *Modern Castings,* v. 33, June 1958, p. 51-55.

Investment casting molds made by coating wax pattern with slurry and aluminum oxide produce good castings in less time with reduced costs. (E15, W19g)

474-E. Carbon Dioxide Cores in a Malleable Foundry. George Nestor. *Modern Castings,* v. 33, June 1958, p. 56-60.

(E21g)

475-E. Problems Encountered in Casting Reactive Metals. W. A. Aschoff and D. H. Blair. *Modern Castings,* v. 33, June 1958, p. 61-64.

High cost, difficulty of temperature control, lack of suitable mold materials are factors to be overcome before castings of this type are feasible on a large scale. (E-general; Zr, Ti)

476-E.*. The Problem of Hot Molding Sands. R. W. Heine, E. H. King and J. S. Schumacher. *Modern Castings,* v. 33, June 1958, p. 65-71.

Sands must be cooled to 160-170° F. before effective mulling can begin. Other problems such as moisture condensation, sticking

sand, become less severe as it is cooled to 120° F. or lower. (E18)

477-E. Steel Scrap Specifications for Duplexing Cupola White Iron. R. H. Greenlee. *Modern Castings,* v. 33, June 1958, p. 72-74.

Careful control of scrap purchased, to eliminate undesirable alloys and other unsatisfactory conditions, results in marked savings in material and cost.
(E10a, RM-p, ST, CI-p)

478-E.* The Chemical Treatment of Copper Alloys. R. W. Ruddle. *Modern Castings,* v. 33, June 1958, p. 75-81.

Review of chemical methods of treating alloys to reduce melting losses, prevent dross formation, remove gases, or produce desired grain structure. 17 ref.
(E25; Cu, *Sn, Pb, Zn*)

479-E. Sieve Ratios and Processing for Strong Molding Sands. J. Parisi, O. C. Nutter and C. Michalowski. *Modern Castings,* v. 33, June 1958, p. 82-87.

Analyses of grain sizes and packing characteristics, tempering and mulling variables. Recommendations for optimum results. (E18)

480-E.* The Effect of Some Gases on the Work of Adhesion Between a Novolak and Quartz. Dennis W. G. White and Howard F. Taylor. *Modern Castings,* v. 33, June 1958, p. 92-98.

A quantitative study of the individual effect of nitrogen, oxygen, water vapor and ammonia on the bond strength between phenolformaldehyde resin and a refractory metal oxide. These experiments lead to conclusions regarding the bond between the resin and metal oxide of a shell mold. 11 ref. (E19c, E18n)

481-E.* Industrial Applications of Olivine Aggregate. Gilbert S. Schaller and W. A. Snyder. *Modern Castings,* v. 33, June 1958, p. 99-104.

Compared to silica, olivine offers slightly greater cooling effect, increased heat capacity, uniform thermal expansion, resistance to fracture by thermal shock. It is replacing conventional materials in several specific applications. (E18r)

482-E.* On the Release of Hydrogen From Molten Aluminum. Asutosh Pal and H. M. Davis. *Modern Castings,* v. 33, June 1958, p. 105-108.

A significant portion of the hydrogen in molten Al can be removed by treatment with briquettes containing magnesium oxychloride weighted with corundum. The decomposition products of the briquettes make no objectionable addition to the Al. 6 ref. (E25s; Al, *H*)

483-E. Permanent Mold Casting With New Magnesium Alloy. Frank Gaines. *Western Metalworking,* v. 16, May 1958, p. 48-49.
(E12; Mg-b, *Th, Zr*)

484-E.* (French.) **Employment of Gases in the Foundry and in Metallurgy.** Albert Portevin. *Fonderie,* v. 147, Apr. 1958, p. 153-156.

Employment of gases in metallurgy from the physico-chemical and the chronological viewpoints. In the former there is the effect of the gases on the quality of the casting; in the latter the role of the gases is considered in melting, pouring and solidification.
(E-general; EG-m44)

485-E. (French.) **Graphitization of Castings by Gas Inoculation.** Georges Blanc and Nicolas Volianik. *Fonderie,* v. 147, Apr. 1957, p. 157-173.

Nitrogen gas is bubbled through a casting bath by a graphite tube. Machinability of thin gray iron castings is improved by avoiding the formation of hard zones due to the presence of cementite. Other advantages are elimination of inclusions and stability of the graphite. 38 ref. (E25n, G17k; CI-n)

486-E. (French.) **Some Metallurgical Phenomena in the Cupola Furnace.** Francois Danis. *Fonderie,* v. 147, Apr. 1958, p. 179-182.

Summary discussion based on previously conducted studies of the influence of the quantity of air in casting analysis and carburization phenomena. (E10a; CI)

487-E.* (French.) **Impregnating Porous Pieces for Water Tightness.** *Fonderie,* v. 147, Apr. 1958, p. 183-191.

Effectiveness of various impregnating products available on the French market for rendering castings water-tight under pressure. Casting specimens were light alloy and bronze disks. (E25, EG-a39, Cu-s)

488-E. (German.) **Determination of Bath Volume in Melting Titanium in Arc Furnace.** Alexej Nowikow and Robert Brenner. *Zeitschrift für Metallkunde,* v. 49, Apr. 1958, p. 199-201.

Method to calculate depth of the bath on the basis of distribution of an extraneous metal. Experimental

technique using manganese. Calculation of bath depth by the method of the smallest squares. (E10r; Ti)

489-E. (Italian.) **Die Casting.** Roberto Allara. *Rivista di Meccanica,* v. 9, Mar. 1, 1958, p. 17-31.
(E13)

490-E. (Italian.) **Technique and Applications of Investment Casting.** Oscar Gherbaz. *Rivista di Meccanica,* v. 9, Mar. 1, 1958, p. 47-52.
4 ref. (E15)

491-E.* (Japanese.) **Mechanism of Hot Tearing in Steel Casting. Pt. 1. Results of Observing Hot Tear Fractures and Metallographic Structures Around Hot Tears.** Susumu Oki. *Japan Foundrymen's Society, Journal,* v. 30, Feb. 1958, p. 83-88.

Hot tear fractures and metallographic structures around hot tears in sand cast carbon steel castings containing 0.20 to 0.25% carbon and having wall thickness of 10 to 50 mm. Almost all the hot tears showed indications that they grew between dendrites of primary crystals. In a few cases, hot tearing occurs on boundaries of primary austenite grains after complete solidification. This kind of hot tear can easily be distinguished from interdendritic ones. 6 ref. (E25n, 9-72; ST)

492-E. (Japanese.) **Cupola Studies. Pt. 3. Notes on Blast Flow.** Toru Ishino. *Japan Foundrymen's Society, Journal,* v. 30, Feb. 1958, p. 95-103.
(E10a, W18d)

493-E.* (Japanese.) **Packing Properties of Molding Sand.** Jiro Kashima and Kazuya Miyazaki. *Japan Foundrymen's Society, Journal,* v. 30, Feb. 1958, p. 104-107.

Relationship between packing properties and grain size distribution of a molding sand, where the degree of ramming is constant. Maximum packing property was obtained when the mixing ratio in weight of coarse and fine grain size of uniform sands was 4:6. Packing properties of sands are also influenced by the choice of binders. 5 ref.
(E18r)

494-E.* (Japanese.) **Study on Sand Adhesion to Castings. Pt. 1. Velocity of Liquid Metal Penetration in Sand Mold.** Toshiro Owadano and Hideo Mikashima. *Japan Foundrymen's Society, Journal,* v. 30, Feb. 1958, p. 108-113.

Velocity of metal penetration in sand mold investigated by attaching the sand specimen to the surface of molten Pb and Sn, which are kept at constant temperatures, and applying negative pressure to the specimen for penetration. The sand specimen is prepared by baking sieved silica sand mixed with linseed oil as a binder. Depth of metal penetration is related to the time of penetration. 10 ref. (E11; 1-54)

495-E.* (Japanese.) **Some Studies on Cupolas. Pt. 4. Relation Between Air Flow and Chemical Reaction in the Cupola on Melting Conditions.** Toru Ishino. *Japan Foundrymen's Society, Journal,* v. 30, Mar. 1958, p. 144-152.

Melting rate, properties of melts, gas distribution and changes of blast pressure in the furnace. Effects of small and large tuyeres.
(E10a)

496-E.* (Japanese.) **Some Considerations on Cupola Operation by Mixing Tekken Briquette Coke.** Masao Sawada. *Japan Foundrymen's Society, Journal,* v. 30, Mar. 1958, p. 159-166.

No difference in the quality of molten iron can be observed when the low-sulphur coke and the Tekken briquette coke are mixed in a 50:50 ratio and used as split coke in the hot blast cupola. 8 ref.
(E10a; RM-j43; CI)

497-E.* (Japanese.) **Segregation in Castings. Pt. 7.** Kazuo Yasuda. *Japan Foundrymen's Society, Journal,* v. 30, Mar. 1958, p. 166-170.

Segregation in samples of 99.07% pure aluminum and Al-Cu alloy of 5.8% Cu were used for the preparation of samples solidified at different rates. 7 ref.
(E25n, 9-69; Al, *Cu*)

498-E. (Russian.) **Defects Caused by Phosphorous Impurities in German Silver Alloys.** Z. Hegedus and M. Stefan. *Acta Technica,* v. 20, no. 3-4, 1958, p. 297-304.

Effect of phosphorus contamination on structure and technological properties of Cu-Ni alloys.
(E25q, Q-general, 9-69; Cu, *Ni, P*)

499-E. (Russian.) **Linear, Surface and Blowhole Shrinkage of Magnesium Cast Iron.** K. I. Vashchenko, R. P. Todorov and V. V. Zhizhchenko. *Liteinoe Proizvodstvo,* v. 2, Feb. 1958, p. 14-20.

Study of the shrinkage of magnesium cast iron as a function of the chemical composition, in particular Mg and Si content, and the crystallization time factor. 16 ref.
(E25n, P10c; CI-r)

500-E. (Russian.) **Deoxidation of Lead Bronze Bearings With Powdered Material (70% Pb, 30% Cu).** G. S. Pronyakov. *Vestnik Mashinostroeniya,* no. 2, Feb. 1958, p. 61-63.
(E25s; Cu-s, *Pb,* AD-r)

501-E. A French Glossary for Foundrymen. Pt. 1. *British Cast Iron Research Association, Bulletin,* v. 14, May 1958, p. 353-361.
Compilation by the abstracting staff of the British Cast Iron Research Association. (To be continued.) (E-general, 11-67)

502-E. Foundry Modernization. Pt. 3. Robert H. Herrmann. *Foundry,* v. 86, June 1958, p. 63-64.
General Electric's permanent mold gray iron casting facilities, pattern shop and quality control operations. (E12, W19, 18-67; CI-n)

503-E. Automated Molding and Pouring. *Foundry,* v. 86, June 1958, p. 71-76.
(E19, E23, 18-74)

504-E.* Effects of Composition on Soundness and Properties in Some Foundry Bronzes. W. T. Pell-Walpole. *Foundry Trade Journal,* v. 104, June 5, 1958, p. 681-686.
Critical pouring temperature for the rapid deterioration in density and mechanical properties which sand-cast bronzes and gun-metal suffer is directly related to the solidus of the alloy and is therefore very sensitive to its phosphorus content. A mold wash of 10% Al_2O_3, 10% plumbago in tar-oil, raises the critical temperature for reaction and thus extends the safe-range. (E25n, E22s; Cu-s)

505-E.* High-Speed Diecasting Line Features Automatic Pouring. Herbert Chase. *Iron Age,* v. 181, June 12, 1958, p. 96-98.
Die casting of aluminum turbo-type torque converter transmission parts with automatic pouring. Holding furnaces automatically send a precise amount of molten Al to the diecasting unit. Dies weigh 17½ tons, are parted through the long axis of the casting. Large hydraulically actuated cores are pulled horizontally from each end of the casting. Radiant gas heaters keep dies hot during production lull.
(E13, T21c; Al)

506-E. Vacuum Die Castings of Zinc Have Low Porosity, Good Surface, Thin Walls. John L. Everhart. *Materials in Design Engineering,* v. 47, June 1958, p. 110-112.

546-E.* Effect of Ferrosilicon and Magnesium Inoculation on Nuclei Formation in Cast Iron. Fredrik Hurum. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 66-74.

Examination of the process whereby ferrosilicon absorbs iron from the melt prior to dissolving. Three phases, epsilon (FeSi), alpha (silicoferrite) and gamma (silico-austenite) were formed. Results of further studies of graphite spherulites. (E25q, CI-r)

547-E.* Effect of Temperature on the pH of Foundry Sands. N. D. Brinkmann and Gordon Gottschalk. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 84-87.

Apparently calcium carbide present in particles of sea shells in sand changes to calcium oxide at 1500°, resulting in marked change in pH. Rise in pH is associated with decrease in physical properties of baked cores. (E18r, 2-61)

548-E. European Foundries and Pattern Shops. E. T. Kindt. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 94-96.

(E-general, 18-67)

549-E.* Hot Tearing of Magnesium Casting Alloys. R. A. Dodd, W. A.

Pollard and J. W. Meier. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 100-117.

Susceptibility to hot tearing of Mg-Al and Mg-Zn alloys containing up to 10% alloying additions, and of 17 other important Mg alloy compositions determined by various methods, involving measurement of the cracking tendency of flat rings cast in steel or sand molds. 39 ref. (E25, 2-60; Mg-b, 9-72)

550-E.* How to Determine Moisture Requirements of Molding Sands. R. W. Heine, E. H. King and J. S. Schumacher. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 118-122.

Water requirements for obtaining peak strength in molding sands are quantitatively related to the ingredients of the sand mixture. (E18p)

551-E.* Mold Hardness: What It Means! R. W. Heine, E. H. King and J. S. Schumacher. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 123-127.

Basic relationship of mold hardness to green strength. The relationship is generally applicable to clay-saturated sands. In clay-poor sands, the relationship depends on clay content and factors influencing clay distribution. 5 ref. (E18r, E19)

552-E.* Correlation Between Casting Surface and Hot Properties of Molding Sands. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 128-133.

Two simple one-specimen tests to measure scabbing, buckling and rat-tailing tendencies of molding sands for iron casting. (E18r)

553-E.* Effects of Charge Materials and Melting Conditions on Properties of Malleable Iron. E. H. Belter and R. W. Heine. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 134-139.

Annual progress report on A.F.S. malleable iron research project. Effect of pig iron variations in the charge on the casting properties, mechanical properties and annealability of malleable iron; variations in melting technique in an effort to change residual element recovery after melting; correlation of Si oxidation with changes in residual element recovery; effect of holding time at 2800° F. on the mechanical properties. 9 ref. (E10, CI-s)

554-E.* Influence of Sand Grain Distribution on Green-Sand Casting Finish. C. E. McQuiston. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 188-206.

The mean sand grain diameter is the most important factor contributing to roughness. The spread contributes to roughness but to a lesser degree than the mean diameter. The effect of squeeze pressure on roughness is minor in the range of this experiment. 31 ref. (E18r)

555-E.* Fluidity of a Series of Magnesium Alloys. J. E. Niesse, M. C. Flemings and H. F. Taylor. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 207-211.

Fluidity of Mg-rich portions of seven different Mg alloy systems presented as a function of composition. Data for both constant superheat and constant pouring temperature. Addition of Zr to Mg alloys lowered the fluidity at low alloy content, but slightly raised the fluidity at alloy contents above 4%. 5 ref. (E25p, 2-60; Mg-b)

556-E. Efficient Cupola Operation. *Australian Manufacturer,* v. 42, Mar. 1, 1958, p. 60-65, 70.

Interdependent factors affecting cupola operations such as types of lining, cokes, sulphur in the cast iron, fluxes and tuyere design. (E10a)

557-E.* Desulphurization of Iron and Steel. Pt. 1. S. L. Gertsman. *Canadian Metalworking,* v. 21, June 1958, p. 33-35, 37.

More scrap iron may be used in the cupola if the sulphur is reduced; there is less danger of producing iron with an improper Mn:S ratio; less Mn can be used for steel; hot tearing characteristics of cast steels are associated with sulphur content. High sulphur appears to increase the tendency toward hot tearing. (E10a, E25; CI, ST)

558-E. Molding Castings for Rolling Stock. J. G. H. Loubser. *Engineer and Foundryman,* v. 22, Feb. 1958, p. 99-107.

(E19, T23)

559-E. Shell Molding—Automated. T. E. W. Preston. *Metalworking Production,* v. 102, June 6, 1958, p. 983-991.

Application of shell-molding technique with a comparatively simple electro-pneumatic system of control. (E16c; 18-74)

560-E. Investigations on the Effect of Heat on the Bonding Properties of Various Bentonites. Franz Hofmann. *Modern Castings,* v. 34, July 1958, p. 31-37.

6 ref. (E18n)

561-E. Gating and Risering Shell Mold Pattern Equipment. D. C. Kidney. *Modern Castings,* v. 34, July 1958, p. 38-40.

(E16c, E22p, E22q)

562-E.* Sodium Silicates for the CO_2 Process. E. A. Lange and R. E. Morey. *Modern Castings,* v. 34, July 1958, p. 41-49.

Chemistry of the CO_2-sodium silicate process for bonding foundry sand. The amount of CO_2 necessary to develop maximum gassed strength is that required to increase the SiO_2 to Na_2O ratio of the sodium silicate to 4. The efficiency of the CO_2 gassing process can be greatly increased by diluting the CO_2 with air. (E18n)

563-E.* Foundry Applications of the Calcium Carbide Injection Process. W. R. Lysobey and A. E. Tull. *Modern Castings,* v. 34, July 1958, p. 53-61.

Injection of calcium carbide in cast iron will reduce chill formation and promote the formation of Type-A graphite in a pearlitic matrix. The extent of the calcium carbide injection treatment required to produce the optimum physical properties and microstructure will depend upon iron composition and solidification rate. (E25q; CI)

564-E.* Performance of Chills on High Strength Magnesium Alloy Sand Castings of Various Section Thicknesses. Merton C. Flemings, Richard W. Strachan, Ernest J. Poirier and Howard F. Taylor. *Modern Castings,* v. 34, July 1958, p. 62-69.

Effect of section thickness and chilling on the mechanical properties of sand cast Mg alloy test plates. The alloys studied were AZ92A and AZ91C. Plate thickness was varied from ¼ to 1½ in. (E22r; Mg-b)

565-E.* (French.) What Causes Pinholes? S. A. Sanders. *Fonderie,* v. 145, Feb. 1958, p. 53-63.

Thermodynamic study indicates that hydrogen dissolved in steel does not create sufficient gas pressure to form cavities and that no hydrogen-oxygen reaction accompanies formation of steam. Probable cause of pinholes is carbon oxide which forms as by reaction of carbon in steel with iron oxide formed at mold-metal interface. (Pinholes do not form in presence of Al in solution because oxygen reacts with Al rather than with carbon). Theory is advanced that many so-called pinholes should be classified as inclusions. Cermet-type inclusions, also called ceroxides, and their influence on pinhole porosity. 19 ref. (E25, 9-68, 9-69; ST)

566-E.* (French.) Oxygen in the Cupola. Francois Danis. *Fonderie,* v. 145, Feb. 1958, p. 79-86.

Super-oxygenation of blast increases hourly production, decreases percentage of loss of Si, improves castability of melt. Addition of oxygen apparently has no effect on carburization and loss of Mn during melting. (E10d; ST)

567-E.* (French.) Influence of Rate of Air Supply, Coke Size and Coke Rate Between Charges on Cupola Operation. Francois Danis and Maurice Decrop. *Fonderie,* v. 148, May 1958, p. 215-233.

Thermal balance sheets and productivity of cupola (700 mm. nominal i.d.) for varied operating conditions during 19 experimental melts. All materials charged into cupola, all products of fusion were carefully measured and analyzed; constant check of temperatures was maintained. The 90-120 coke appears to be best suited for standard, foundry-size cupola. (E10a; RM-j43, CI)

568-E. (German.) Fluid Dynamics Applied to the Construction of Die Casting Dies for Aluminum Die Casting. Hermann Kessler. *Zeitschrift für Metallkunde,* v. 49, May 1958, p. 250-256.

Flow of molten metal into die casting dies; vacuum die casting process. (E13, 1-73, W19n)

569-E.* (Japanese.) Segregation in Castings. Pt. 8. Kazuo Yasuda. *Japan Foundrymen's Society, Journal,* v. 30, May 1958, p. 379-385.

Basic experiments on segregation conducted to substantiate theoretical mechanism of the shape of segregation curves. When the size of castings was reduced the flat portion of the segregation curve corresponding to the intermediate layer of castings was lower and the degree of segregation decreased. Segregation in cylindrical castings was higher than in flat castings. 6 ref. (E25n, 9-69)

570-E.* (Japanese.) **Study on the Shell Molding Process. Pt. 1. Influence of Thickness and Bending Strength of Shell.** Hideji Hotta. *Japan Foundrymen's Society, Journal,* v. 30, May 1958, p. 385-394.

Influence of kinds of silica sands, additional amounts of synthetic resins and wetting agents on temperature, time of setting on the curing of shell molds and bending strength and thickness. Both the thickness and the bending strength of shell become greater as the setting temperature, time and the curing temperature become greater. 12 ref. (E19C)

571-E.* (Japanese.) **Studies of Foundry Silica Sands. Pt. 4. Crushing of New Foundry Silica Sands.** Umeji Harada and Keizo Nishiyama. *Japan Foundrymen's Society, Journal,* v. 30, May 1958, p. 395-405.

Geological origin, crystal structure, hot properties and refractory properties of four silica sands. Crushing method is by ramming. Grain sizes of the sands are 35, 48, 65, 100 and 150 mesh. (E18r)

572-E.* (Japanese.) **Binding Materials for Foundry Sand. Inorganic Binders.** Hiromu Tanimura and Shizuo Mukae. *Japan Foundrymen's Society, Journal,* v. 30, May 1958, p. 405-417.

Clays were submitted to chemical analysis, X-ray analysis, electron microscopy and differential thermal analysis, while their swelling capacity, base exchange capacity, pH value and others were measured and correlated with binding capacity. 17 ref. (E18n)

573-E.* (Spanish.) **Porosity in 85-5-5-5 Type Bronze Castings.** Sebastian F. Matas. *Revista de Ciencia Aplicada,* v. 12, Mar-Apr. 1958, p. 136-144.

Contraction during solidification, gases, metal-mold reaction as principal causes of porosity. Means of reducing porosity. Need for further study of such factors as compatibility of 85-5-5-5 bronze and mold materials, metal-mold reaction, control of absorbed gases, amount of phosphorus used for deoxidation, effect of binders and addition agents used in mold and core sand, degassing methods, crystal structure of alloy. 15 ref. (E25; Cu-s, 9-68)

574-E.* **Influence of Vibration on Solidifying Metals.** A. H. Freedman and J. F. Wallace. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 578-589.

Vibration applied to solidifying Al-Cu alloys refined grain size, improved tensile properties. Hypothesis offered to explain observations. 8 ref. (E25n; EG-a38)

575-E.* **Tin as an Alloy in Gray Cast Iron.** J. A. Davis, D. E. Krause and H. W. Lownie. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 590-597.

Tin contents of 0.10% or less resulted in slightly improved mechanical properties without producing any undesirable properties. No embrittling effects of Sn were found at levels up to 0.10%, and it is in this range that Sn had its major beneficial effects upon microstructure and mechanical properties. (E25q; CI-n, Sn)

576-E.* **An Appraisal of Steels for Aluminum Die Casting Dies.** J. C. Hamaker and G. A. Roberts. *Die Casting Engineer,* v. 2, June 1958, p. 11-13.

Causes of heat checking, pitting, impingement soldering; requirements of a good die casting steel; precautions for maximum die life. (E13; SS)

577-E. (German.) **Prevention of Casting Defects.** Hans Reininger. *Giesserei-Praxis,* v. 76, Apr. 25, 1958, p. 137-142.

Proper gating assures uniform heating and cooling in the most intricate parts and eliminates defective hardening. Model altering and use of chills in the critical parts also advised. After annealing slowly cooling prevents overhardened surfaces. The growth of metal at high temperatures can be avoided by use of cast iron of high heat stability. Fine-grained graphitic hard iron advised ferritized through afterward annealing. At lower temperatures (e.g., up to 500° C.) certain alloying elements such as Cr, Mn, V, act as stabilizators. Examples are from the practice with micrographs and illustrations. (E-general)

578-E.* (German.) **Investigation on the Use of Calcium Carbide in Cupola Furnace Operation.** Kurt Giesen. *Giesserei-Praxis,* v. 76, June 10, 1958, p. 219-222.

A report on the use of a specially developed calcium carbide for cupola furnace work. Data show that addition of carbide increases the flow temperature of the iron without increasing the sulphur content and

lowers sulphur content up to about 35% if the usual melting temperature is maintained. 11 ref. (E10a; AD-a)

579-E.* (Italian.) **Improvements in Cupola Operation. Results Obtained From a Basic Cupola.** Mario Olivo. *Fonderia,* v. 7, Apr. 1958, p. 137-142.

Conversion of standard foundry cupola from acid to basic process, using cold blast, with no forced cooling between melts, resulted in following advantages: almost total elimination of shrinkage cavities in castings; elimination of slag formation in ladle; cast iron of high machinability even when Si content is low; improved mechanical properties of product; possibility of refining charges composed of low-grade miscellaneous cast iron scrap, scrap iron and steel, with almost total elimination of pig iron requirement; reduced manufacturing costs due principally to possibilities of using less expensive charges. Suggestion is made that cupola with I. D. of 800 mm. or more be adopted to make application of refractory linings easier and melting more even, and to avoid formation of abundant and not always fluid slag. 12 ref. (E10a)

580-E. Pressure Tightness in 85-5-5-5 Bronze Castings. P. K. Trojan and R. A. Flinn. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 238-246.

To investigate the basic nature of leakage under pressure for this material and to evaluate the effects of melting and molding variables, a sensitive and reproducible test bar and leak test procedure have been developed. 5 ref. (E11; Cu-S)

581-E.* Investigation of Metallurgical and Mechanical Effects in the Development of Hot Tearing. H. F. Bishop, C. G. Ackerlind and W. S. Pellini. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 247-258.

The contraction characteristics of metals in sub-solidus temperature ranges is an important factor in development of either adverse or beneficial mechanical conditions with respect to hot tearing. 7 ref. (E25n, 9-21)

582-E.* Performance of Chills on High Strength-High Ductility Sand-Mold Castings of Various Section Thicknesses. M. C. Flemings, P. J. Norton and H. F. Taylor. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 259-266.

Data showing effect of casting thickness on ability of chills to increase mechanical properties of cast Al alloy sections varying from ¼ to 1½ in. thick; data on end-chilled plates of 195 and 356 alloys. Mechanical properties of the end-chilled plates decrease with increasing distance from the chills. 6 ref. (E22r, 5-66, Al-b)

583-E. Gating of Gray Iron Castings. J. F. Wallace and E. B. Evans. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 267-275.

(E22p; CI-n)

584-E. Temperature Drop in Pouring Ladles. Pt. 2. V. Paschkis and J. W. Hlinka. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 276-281.

(E23)

585-E.* Effect of Small Tin and Cadmium Additions to Aluminum-Copper Alloys. H. V. Sulinski, R. C. Harris and S. Lipson. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 282-291.

The effect of small quantities of Sn and Cd on the aging characteristics and tensile properties of cast and heat treated Al-Cu alloys centering around the commercial 195 alloy composition (Al-4.5% Cu). Results suggest that the Sn additions are slightly more effective than the Cd. 19 ref. (E25; Al-b, Cu-b)

586-E. Practical Studies of Veining Tendencies. George Di Sylvestro. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 323-339.

The following factors promote or affect veining in steel castings: increased gas evolution; variations in raw materials; coarser sand; insufficient venting; insufficient baking; silica flour additions. The veining defect may be improved by the use of a test casting as a standard for comparison, quality control of raw materials, and use of finer sand, iron oxide, bentonite, fire clay, and core binders with a low gas content and rate of evolution. (E18r)

587-E.* Inoculation of Gray Cast Iron. N. C. McClure, A. U. Khan, D. D. McGrady and H. L. Womochel. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 340-349.

The most effective inoculant for the improvement of mechanical properties in these experiments was the Ca-Si alloy with approximately 30% Ca. Ca additions effected a reduction of the carbon content of molten iron by formation of a carbide of low solubility; it is suggested that calcium carbide is involved in the mechanism of Type-A graphite formation. 9 ref. (E25q; CI-n, *Ca, Si*)

588-E. Hydrogen as It Affects Steel Castings. Arthur F. Gross. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 365-373.

Through proper melting control the steel foundryman can eliminate any permanent defects attributable to hydrogen. The loss of tensile ductility is a temporary effect which eventually disappears on natural aging and may be quickly eliminated by artificial, low-temperature aging treatments. Hydrogen embrittlement does not make the steels notch sensitive. Flaking as a result of hydrogen is seldom if ever encountered in castings. (E25; ST, 9-68)

589-E.* Mechanical Properties of Cast Titanium-Iron and Titanium-Aluminum-Iron Alloys. N. Hehner, H. W. Antes and R. E. Edelman. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 374-378.

An investigation to determine the as-cast tensile and impact properties of Ti-Fe and Ti-Al-Fe cast alloys. The tensile strength of both binary and ternary alloys increased appreciably as the Fe content was increased. Results indicate that a Ti-3% Al-5% Fe would be particularly amenable to heat treatment. 10 ref. (Q21, Q27a; Ti-b, Al, Fe)

590-E.* Effect of Various Clays and of Tempering Method on Sand Properties and Casting Quality. A. E. Murton. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 379-385.

Four commercial foundry bonding clays were tested to determine the properties they would produce in foundry sand mixtures. The clays tested were western and southern bentonite, Ohio fire clay, and Illinois illite. 6 ref. (E18r)

591-E.* Feed Metal Requirements for Ductile Iron Castings. C. Reynolds, J. Maitre and H. Taylor. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 386-390.

Precipitating graphite is beneficial in lowering feed metal requirements, and if present in sufficient amount many castings can be made in rigid molds without risers. The main effect of increasing silicon is allowing more graphite to precipitate because of the decreased solubility of carbon in austenite. (E23; CI-s)

592-E. Transport of Feed Metal During Solidification of Tapered Steel Bars. E. J. Sullivan, C. M. Adams and H. F. Taylor. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 394-401.

Experimental and theoretical studies of the padding requirements for cylindrical cast plain carbon steel bars. 9 ref. (E23; ST-a)

593-E. Properties of Molding Sands Under Conditions of Gradient Heating. N. C. Howells, R. E. Morey and H. F. Bishop. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 402-408.

A new hot strength test used on molding and core sands. Various mixtures were tested under conditions which represent mold interface regions for castings that solidify in the vicinity of 2000 to 2400° F. 6 ref. (E18r)

594-E.* Investigation of the Effect of Processing Variables on Mechanical Properties of Pearlitic Malleable Iron. H. H. Johnson and W. K. Bock. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 450-461.

Statistical study of atmosphere, tempering time and temperature, quenching time, temperature and rate and other variables on mechanical properties. (E25; CI-s)

595-E.* Vacuum Die Casting. David Morgenstern. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 494-498.

Use of a vacuum box around the die, rather than locating the vacuum within the die, permits more rapid operation, minimizes air entrapment, improves mechanical properties of casting. (E13, 1-73)

596-E. Status of the Technology for Casting Titanium. G. H. Schippereit, R. M. Lang and J. G. Kura. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 499-512.

Survey of furnace types, molds, precision casting, properties of cast alloys, potential market, availability. 36 ref. (E-general; Ti)

597-E.* The Use of Expendable Graphitic Molds in the Production of Sound, Ductile Titanium Castings. A.

L. Feild and R. E. Edelman. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 517-522.

These molds can be made using conventional foundry techniques. The molds are expendable, economical to produce, and strong. In addition, molten Ti metal poured in section thicknesses as great as 2 in. will not be contaminated by the mold material. (E19; Ti-b, NM-k36)

598-E. "Slice 'em Yourself" Castings. *American Machinist,* v. 102, June 1958, p. 76-77.

Continuously cast Cu alloy rods, tubes and shapes up to 12 ft. long can be cut apart into individual castings. All standard tin-bronze alloys, including Pb, Zn and Ni, bearing varieties, can be cast to size. (E-general; Cu)

599-E. The Ford "Thames" Foundry. *Automobile Engineer,* v. 48, June 1958, p. 233-246.

New Ford Motor Co. foundry in England produces four-cylinder and six-cylinder engine blocks and heads. About 42 different castings are handled. Equipment and layout. (E-general, T21b; 18-67)

600-E.* Kinetics of Alloy Solidification. K. A. Jackson. *Canadian Journal of Physics,* v. 36, June 1958, p. 683-691.

Alloy systems discussed in terms of the theory of interface kinetics. The nonequilibrium equations which are developed reduce to the thermodynamic expressions if the system is in equilibrium. Several types of phase diagrams are discussed. It is shown that a phase diagram gives a reasonably good estimate of the concentrations at an interface if the system is not in equilibrium. (E25n, M24)

601-E. High Temperature Tooling for Die Casting. E. E. Hall. *Die Casting Engineer,* v. 2, Mar. 1958, p. 10-11, 22.

Briefly related chemical composition of hot work toolsteels with minimum distortion during heat treatment. Resistance to heat checking, toughness, wear resistance, resistance to softening, thermal conductivity and other properties necessary for die casting die materials. (E13, W19n; TS)

602-E. Solve Your Die Temperature Control Problems. H. A. Meyrick. *Die Casting Engineer,* v. 2, Mar. 1958, p. 12-13.

Variation of die casting die temperature with pressure, time and metal temperature; control of die temperatures by system employing high velocity circulation of a control temperature liquid. (E13, W19n, 2-61)

603-E.* Steps to Take in Eliminating Hot Tears. Hubert Chappie. *Foundry,* v. 86, July 1958, p. 82-84.

Experiences with large castings of 0.40 carbon steel. Corrective actions required to avoid hot tears included use of wood flour, multiple gating, external chills, staggering of ribs, control carbon content. (E-general; CN, 9-71)

604-E. Mechanized Molding Line Produces Gray Iron Brake Drums. Robert H. Herrmann. *Foundry,* v. 86, July 1958, p. 90-93.

(E19; CI)

605-E. The Importance of Clay Particle Size. Walter E. Gruver. *Foundry,* v. 86, July 1958, p. 94-96.

Relation of clay particle size to properties of foundry sands; method for size determination. (E18r)

606-E. Gray Iron Foundry Pursues Continued Plant Improvement. Kenneth L. Mountain. *Foundry,* v. 86, July 1958, p. 98-101.

At the Inter-State Foundry Co., Indianapolis. (E-general; 18-67, CI-n)

607-E.* The Establishment of Dimensional Norms for Die Castings. H. K. Barton. *Machinery,* v. 92, no. 2359, Jan. 31, 1958, p. 267-276.

Tolerances are discussed at length, with particular reference to standards introduced by the Zinc Alloy Die Casters' Association for the guidance of British designers and buyers. Short history of the die casting industry; tendency for users of die castings to "over specify" is discussed. Factors which affect the dimensional accuracy and the A.D.C.I. tolerances. (E13, A2, S22)

608-E. Die Cast Record Changer. *Metal Industry,* v. 92, June 20, 1958, p. 511-513.

Die casting practice at Collaro Ltd. in the production of cam gear, spigot housing and turntable bosses for record changers. (E13, T10c)

609-E. Investment Casting in Europe. H. J. Marshall. *Precision Metal Molding,* v. 16, June 1958, p. 24-26.

(E15)

610-E. A Vacuum System for Die Casting Aluminum. G. R. Morton. *Precision Metal Molding,* v. 16, June 1958, p. 30-32.

(E13, 1-73; Al)

611-E. (French.) **Future Progress in the Melting of Metals.** Frank Hudson. *Fonderie Belge,* v. 28, May 1958, p. 154-162.

Fuels and melting furnaces; use of hydrogen, oxygen and nitrogen. (Conclusion.) 10 ref.
(E10, W18, RM-j, RM-k, RM-n)

612-E.* (Italian.) **Testing of Oily Sand Binders.** Rinaldo Cattaneo. *Fonderia,* v. 7, May 1958, p. 201-208.

Procedures and equipment for determining viscosity, specific weight and iodine number of binders; significance of these properties. (To be continued.) (E18n)

613-E.* (Italian.) **Formless Refractories for Foundry Use.** Luihi Ferro. *Fonderia,* v. 7, May 1958, p. 209-214.

Bulk refractory materials were formed into test pieces. Behavior of basic and acid mixtures, both green and baked, under slag erosion and hot and cold compression tests. High resistance of a basic mixture to an acid slag was noted.
(E10; RM-h)

614-E.* (Russian.) **Modification of Heat Resistant Al-Si Alloys.** T. I. Orlova. *Liteinoe Proizvodstvo,* Apr. 1958, p. 31-32.

Through small addition of B, Ti and P to hypereutectic Al-Si alloys it becomes possible to use alloy for casting pistons which are highly heat resistant, readily machinable, and can be produced very cheaply. 12 ref.
(E25q, T21b, 2-60; Al, Si, *B, P, Ti*)

615-E.* Decarburization of White Irons Under Non-Graphitizing Conditions. C. T. Moore. *B.C.I.R.A., Journal of Research and Development,* v. 7, June 1958, p. 258-261.

In white irons, carbide solution in austenite is a limited factor influencing the rate of carbon removal by gaseous decarburization. Free iron sulphide also seems to reduce the rate of solution of carbide in austenite. (E25; CI-p)

616-E.* Some Factors Influencing the Incidence of Inverse Greyness in White Irons. C. T. Moore. *B.C.I.R.A., Journal of Research and Development,* v. 7, June 1958, p. 262-267.

The effect of ladle additions of B, Bi and ferromanganese, and the effect of sulphur content of the molding sand, on the incidence of inverse grayness in a blackheart malleable iron.
(E11, E25; CI-p, AD-p)

617-E.* Dross Defects in Nodular Iron Castings. A. G. Fuller. *B.C.I.R.A., Journal of Research and Development,* v. 7, June 1958, p. 268-285.

Ladle additions of tellurium in conjunction with cerium have potent effect in reducing dross defects. Control of Mg alloy addition and of Al content is necessary. Other factors include coal dust and moisture content of green sand molds, type of molding material, inoculant used, pouring temperature and gating system. (E11, E25, CI-r, AD-p)

618-E.* (German.) **New Ways of Using Precision Casting.** A. Krekeler. *Industrie-Anzeiger,* v. 80 June 3, 1958, p. 639-641.

Precision casting is used for parts difficult to manufacture by conventional means. An example taken from the turbine field shows that with the aid of pattern assembly it is possible to produce items which were outside the scope of conventional machining methods. Applications include complicated tools in high speed steel, rocket engines, turbines, compressors. 6 ref. (E15)

619-E. Mechanized Manufacture of Flaskless Carbon Dioxide-Waterglass Foundry Molds. K. Haake. *Giessereitechnik,* v. 3, no. 9, 1957, p. 193-197. (Henry Brutcher, Altadena, Calif., Translation no 4213.)

Report on mechanized sand drying and cooling installation and the manufacture of molds and cores by the carbon dioxide-waterglass process without the use of flasks. Foundry mechanization program. Centralized supply of carbon dioxide in foundry. Percentage data on economics of a change-over from green molds made in flasks. Plan for completely mechanized operation.
(E18n, E19, W19g)

620-E. Controlled Gas Content in Foundry Work. E. Scheuer. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 534-542.

Laboratory tests indicated that gas content of the melt is the critical factor in control of surface shrinkage effects. A hydrogen bubbler was designed to regulate this content. 14 ref. (E25s; Al-b)

621-E. Carbon Refractories. Gordon B. Tatum. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 543-549.

Various carbon shapes used for refractory lining in the foundry. For

lining cupolas certain combinations of materials are most satisfactory for particular cupola designs and operating conditions. Construction and maintenance features.
(E-general, 1-52, RM-h 39)

622-E. Rigging Design of a Typical High Strength, High Ductility Aluminum Casting. Merton C. Flemings, Patrick J. Norton and Howard F. Taylor. *American Foundrymen's Society, Transactions,* v. 65, May 1957, p. 550-555.

By careful control of chilling and other variables in casting of Al, ultimate tensile strength is increased up to 95%, yield strength up to 63% and elongation, 1300%. 4 ref.
(E22, Q27a; Al-b)

623-E. Link-Belt's New Foundry Provides Efficient Operations. Robert H. Herrmann. *Foundry,* v. 86, Aug. 1958, p. 40-47.

Standard and pearlitic malleable castings weighing up to 70 lb. are produced in green sand and shell molds in this recently completed mechanized foundry.
(E11, E16c, 18-74; CI-s)

624-E. Controlling Casting Quality Through Sand Testing. Harry W. Dietert. *Foundry,* v. 86, Aug. 1958, p. 58-61.

Two elevated-temperature tests allow determination of tendency of a given sand to cause slabs, rat-tails or buckles. (E18r)

Proceedings of the 61st Annual Meeting, Cincinnati, Ohio, May 6-10, 1957. Papers abstracted separately. (E-general)

661-E.* **Application of Sodium Silicates for Bonding Sands.** F. W. Nield and David Epstein. *Castings,* v. 4, May 1958, p. 5-24.

Relationship between compression strength of sand bonded with sodium silicate cured with CO_2 or uncured and the grade of sodium silicate. concentration of sodium silicate time of CO_2 gassing and temperature to which specimen is subjected Conclusions concerning nature of bond. Relation between drying and compression strength and bench life of sodium silicate sand mixes. 4 ref. (E18n)

662-E.* (French.) **Zones of Influence of Risers. Possible Feed Distances and Effects. Pt. 1.** Richard Namur. *Fonderie Belge,* v. 28, June 1958, p. 191-193.

Mathematical study of solidification, contraction and compensation for contraction; general equations for zones of influence of risers; calculation of duration of freezing at a given point. (To be continued.) (E22q)

663-E.* (French.) **Zones of Influence of Risers. Possible Feed Distances and Effects. Pt. 2.** Richard Namur. *Fonderie Belge,* v. 28, July 1958, p. 209-219.

Applications of formulas presented in Pt. 1 to risers for feeding a flat plate and a square bar. Influence of superheating of molten metal, size of risers, and use of chills on feed distances. Contraction, solidification and heat transfer. 5 ref.
(E22q, E22r, E25n, P11k, 4-53, 4-55)

664-E.* (Italian.) **Pointers on Light Alloy Casting Design.** G. Barchiesi. *Fonderia,* v. 7, June 1958, p. 241-248

Metallurgical, mechanical and physical properties of light alloys. Solidification and use of chills; supply of metal to thick sections; shrinkage; castability of alloys: problems caused by inserts. (E-general, E25, 17-51; Al, Mg, *Cu, Si, Zn*)

665-E.* (Italian.) **Testing of Oily Sand Binders.** Rinaldo Cannaneo. *Fonderia,* v. 7, June 1958, p. 249-255.

Definition, role, procedures for determination of saponification number, surface tension, acidity and water content. Preparation of reactives. (To be continued.) (E18n)

666-E.* (Italian.) **Epoxy Resins in the Construction of Patterns and Core Boxes.** *Fonderia,* v. 7, June 1958, p. 265-268.

Mechanical properties of a typical epoxy resin. Construction of patterns and core boxes by lamination with fiberglass or by casting; machining of cast patterns; simple method of repairing damaged surfaces. Cleaning of equipment used in handling resins; safety precautions to protect respiratory and skin areas. (E17, E18n, E21; NM-d30)

667-E.* (Japanese.) **Pulverizing of Silica Foundry Sands on Shock-Heating.** Umeji Harada and Keizo Nishiyama. *Japan Foundrymen's Society, Journal,* v. 30, June 1958, p. 456-467.

Four typical silica sands were analyzed. Pulverizing of each silica sand shock-heated to 1500° C. was related to grain size. Pulverizing is closely connected with the geological origin of each sand. On the whole, foundry silica sands on shock heating are more pulverized than new sands. Differences in pulverizing on shock-heating become smaller as the grain size diminishes. 12 ref. (E18r)

668-E.* (Japanese.) **Relation Between Grain Size and Permeability in Molding Sand.** Jiro Kashima and Mototaka. *Japan Foundrymen's Society, Journal,* v. 30, June 1958, p. 468-471.

Permeability is determined by grain distribution, grain shape, the quality and quantity of the binder

and the packing rate. Consequently, if the quality and quantity of binder and packing rate are kept constant, the relation between grain size and permeability may be determined in the form of an equation. (E18r)

669-E.* (Japanese.) **Properties of Shell Cores Made by the Blowing Process. Pt. 2. Moldability.** Kaoru Kato. *Japan Foundrymen's Society, Journal,* v. 30, June 1958, p. 472-478.

Shell test specimens were made by a core blower into several kinds of shape. With slender shell cores, resin-coated sand or resin-sand should be blown in the direction of core axes. An injection hole of smaller diameter seems to be beneficial. When the sand is blown in the direction perpendicular to the axis or the surface of the shell core, a specified suitable diameter of injection hole should be selected. (E19c)

670-E. Alloying and Heat Treating Ductile Cast Iron. Massachusetts Institute of Technology. (Watertown Arsenal.) *U. S. Office of Technical Services,* PB 131350, Aug. 1955, 95 p. $2.50.

Basic variables in risering and their effects on shrinkage. Proper control can reduce gross shrinkage to a level at which large sprues and flow-offs are sufficient to act as risers and feed the casting. Sponge-type shrinkage is caused by lack of adequate graphite precipatating. A carbon-silicon relationship was established to eliminate sponge shrinkage. How and where the principles of machinability apply to ductile cast iron; various conditions of cutting ductile iron matrices; and machining forces measured and analyzed; relationships of cutting fluids to machining forces and surface finish. (E22g, P10c, T2, G17k; CI-r)

671-E. Investigation of Nodular Cast Iron Manufactured in the Springfield Armory Casting Laboratory. O. Lubinkowski. Springfield Armory. *U. S. Office of Technical Services,* PB 131399, May 1957, 45 p. $1.25.

Good machinability and toughness of nodular cast iron, its excellent resistance to corrosion and high temperatures, led to successful effort to prepare thin-wall castings less than ½ in. thick. Magnesium-silicon alloy containing copper was used as the inoculant.
(E25; CI-r, *Mg, Si, C,* AD-p36)

672-E. Light Alloy Casting. *Design Engineering,* Aug. 1958, p. 33, 35-51.

Sand casting, permanent mold and die casting of Al, Mg and Mg-Zr alloys analyzed and rontrasted.
(E11, E12, E13; Al, Mg, *Zr*)

673-E. Steel Castings for Heavy Machines. *Foundry Trade Journal,* v. 105, July 3, 1958, p. 15-16. (From *Vestnik Mashinostroeniia,* Dec. 1957, p. 28-32.)

Recent developments in mechanized molding and casting in USSR. (E19, 18-74; ST)

674-E. Chilled Iron Rolls. Production at Thomas Robinson & Son, Ltd. Trevor Kneale. *Iron and Steel,* v. 31, July 1958, p. 351-354.

(E22r, W23k; 5-66, CI)

675-E. Coreless, Hollow Die-Casting. *Metalworking Production,* v. 102, Aug. 1, 1958, p. 1345-1347.

New development in die-casting technique permits hollow casting without the use of cores. Wall thickness can be controlled, casting speed increased, metal saved and weight of product reduced.
(E13, 1-52)

676-E. (German.) **Testing Spherical Castings for Cavities.** Joseph Czikel. *Freiberger Forchungshefte,* v. B30-1, 1958, p. 209-226.

Influence of pouring time and casting temperature. 15 ref.
(E23, 2-61, 3-67; CI, 9-67)

677-E. (German.) **Manufacture and Properties of Resin Coated Sand.** G. Hevenesi and J. Szekeres. *Freiberger Forschungshefte,* v. B30-1, 1958, p. 227-238.

Procedures for preparation of shell-mold sand and testing with different resins and additions.
(E19c, E18n)

678-E. Use of Vacuum in Sand and Gravity-Die Casting to Minimize Waste. L. Pilz. *Giessereitechnik,* v. 2, no. 9, 1956, p. 202-206. (Henry Brutcher, Altadena, Calif., Translation no. 4297.

Application of vacuum to production of extremely light-section and dense castings of nonferrous metals. Portable vacuum installation.
(E11, E13, 1-73, 1-52)

679-E.* **Cast Die Cavities. Pt. 2.** Irwin Lubalin. *Precision Metal Molding,* v. 16, Aug. 1958, p. 30-31.

Shaw process cavities and cores which do not have substantial

amounts of the cast skin removed by machining and polishing result in die life 50 to 60% superior to dies machined by conventional die sinking methods from wrought stock. Also better heat dispersion is found when an entire intricate cavity can be cast in one piece, not in a series of inserts. (E13, W19n)

680-E.* Design Castings for High Stress Uses. *Precision Metal Molding,* v. 16, Aug. 1958, p. 21-22.

High-strength Al casting alloy, tradenamed Tens-50, has superior tensile and yield strengths which permit many forgings to be replaced with castings. Additions of small amounts of Be and Na neutralize the embrittling action of both Fe and Si normally found in casting alloys and improve the fluidity of the melt so that sound, thin walls can be cast.
(E12, E25p; Al, *Be, Na,* 5-63)

681-E.* (German.) Experiments on the Mechanical Qualities of 30-Mm. Diameter Gray-Iron Test Pieces Made With Permanent Molds. Joseph Czikel and Josef Sturm. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 7-45.

Permanent mold methods for obtaining machinable gray iron castings. Influence of cooling velocity on grain tensile strength and Brinell hardness is shown by means of test pieces cast with molds of different temperatures and wall thicknesses. Permanent mold castings have better mechanical properties than sand castings. 35 ref.
(E12, G17k, Q-general; CI, 5-63)

682-E.* (German.) New Foundry Methods: CO_2 Molding, Necking Cores, Calcium Carbide Addition to the Cupola. Gerd Scharf. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 68-83.

Waterglass CO_2 technique; preparation of "necking cores" for facilitation of fettling. In the cold blast cupola furnace, an addition of 0.5 to 1.0% CaC_2 was found most efficient. (E10a, E18n, E21)

683-E.* (German.) Studies on the Continuous Casting of Small Steel Parts in Shell Molds. Hans Woykoss. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 84-97.

Survey of parts for which the method is applicable. Suggestions for the manufacture of metal patterns. Casting in stack molds; vertical and horizontal casting. Manufacture of shell molds, sizes and arrangement of gates, feeders and risers. Machining allowances and shrinkage tolerances.
(E16c, 1-61; ST)

684-E.* (German.) Induction Melting of Cast Iron and Its Significance for the East German Foundry Industries. Gerhard Gertz. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 98-109.

From the viewpoint of East German industry neither the hot blast furnace making high investment necessary nor the cold blast furnace requiring first-class coke have been economically satisfactory. Any country that is forced to import quality coal can use an electric furnace more economically. The most suitable induction furnaces are of a frequency from 2000 to 500 Hz (for charges of about 10 tons). An induction furnace gives cast iron of greater strength. 12 ref.
(E10r, W18a; CI)

685-E.* (German.) Thermal Reclamation of Used Sands. Joseph Czikel and Klaus Quappe. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 110-134.

Different reclamation processes (e.g., air flow, washing with water, and burning the organic components); experiments with the burning procedure. Organic bound sands are reclaimable provided the temperatures are high enough and the quantity of oxygen is sufficient. 10 ref. (E18s, 2-61)

686-E.* (German.) Automotive Parts of Nodular Cast Iron Made in the Cold Blast Cupola Furnace and Treated With Liquid Magnesium. Walter Feicke and Karl Lange. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 181-208.

These parts can compete with those made of malleable cast iron due to their steel-like physical properties and require even less wall thickness. In the Mg treatment a vessel with molten Mg is put on the surface of the molten iron. When the Mg ignites. the vessel is lowered to the pan bottom. Procedure for large and for small quantities. 5 ref. (E25q; CI-r, *Mg*)

687-E.* (German.) Mass Production of Large Diesel Engine Crankcases of Light Metal. Martin Solti. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 239-261.

Old processes; new procedures carried on with new equipment. Details of molding, coremaking, design of pouring basins, runners, gates, skimmer gates and air drains. Melting and casting processes; cleaning and heat treatment of the cast crankcase. 4 ref. (E11, W11j; Al)

688-E.* (German.) **Methods for Increasing the Accuracy of Castings.** Fritz Naumann. *Freiberger Forschungshefte,* no. B30-1, 1958, p. 262-286.

Procedures with sand molds and with permanent molds and dies for the production of parts that require a minimum of machining, or no machining at all. Precision patterns, shell molds, a new kind of pattern. Practical examples.
(E-general, 17-54)

689-E. **Investment Casting of Nonferrous Metals.** E. Weisner. *Foundry Trade Journal,* v. 105, Aug. 7, 1958, p. 163-166.

(E15; EG-a38)

690-E. **Alumina Coated Silica-Sand Molds for Heavy Sectioned Steel Castings.** Béla Körös. *Kohaszati Lapok-Ontöde,* v. 91, Apr. 1958, p. 95-97.

(E19, E18p; ST)

691-E. (Hungarian.) **Producing Colloidal Graphite. Its Use in the Foundry.** Gyorgy Pavai. *Kohaszati Lapok-Ontöde,* v. 91, Apr. 1958, p. 85-90.

Results in coating molds for aluminum, iron, bronze and copper castings.
(E19; Cu, Cu-s, Fe, NM-k36)

692-E. **Formation of Blowholes in Surface of Castings of Magnesium-Treated Cast Iron.** A. D. Ushakov. *Liteinoe Proizvodstvo,* Mar. 1957, p. 19-20. (Henry Brutcher, Altadena, Calif., Translation no. 4291.)

Previously abstracted from original. See item 257-E, 1957.
(E25s; CI, *Mg,* AD-p, 9-68)

693-E. (Russian.) **Application of Malleable Cast Iron for Agricultural Machinery.** M. M. Turbovskii. *Liteinoe Proizvodstvo,* June 1958, p. 2-4.

Melting iron in cupola furnace with oxygen blast in forehearth, sharply reduces cost of metal as compared to use of Duplex process. 9 ref. (E10a, T3, 17-57; CI-s)

694-E. (Russian.) **Mold Pressing Under High Pressure.** I. R. Dudnik. *Liteinoe Proizvodstvo,* June 1958, p. 4-9.

Molding in earthen forms under high pressure results in products of high precision and clean surfaces. Fully mechanized molding assembly. (E19)

695-E. (Russian.) **Mechanization of Assembly, Filling and Knocking-Out of Shell Molds.** A. M. Neimark. *Liteinoe Proizvodstvo,* June 1958, p. 9-11.

(E16c; W19g)

696-E. (Russian.) **Formation of Spheroidal Graphite and Progress in Nodular Iron Technology.** B. S. Mil'man. *Liteinoe Proizvodstvo,* June 1958, p. 11-17.

Method developed for producing spheroidal graphite by use of inert gas in liquid iron of low sulphur content. White iron with high Mg content was used. 22 ref.
(E25q; CI-r, *Mg,* EG-m)

697-E. (Russian.) **Control of Gas Saturation in Casting Copper Alloys.** A. M. Kartseva and T. A. Vikhoreva. *Zavodskaya Laboratoriya,* v. 24, Apr. 1958, p. 410-413.

Method is based on determination of pressure at moment of separation of first bubble of dissolved gases from melt.
(E25s; X12n, Cu-b)

698-E. (Swedish.) **Oxygen in Cast Iron.** Gustav Ostberg. *Gjuteriet,* v. 48, June-July 1958, p. 97-104.

Quantity of oxygen that can be found dissolved in cast iron calculated for the system FeO-C-Si. Results of oxygen determinations in malleable iron; different methods for sampling and analysis.
(E25s, S11r; CI, *O*)

699-E.* **The Controlled-Slag Hot-Blast Cupola.** D. Fleming. *British Foundryman,* v. 51, June 1958, p. 291-302.

Recuperative system for blast heating. Early results and problems, particularly those relating to necessity for controlling high melting temperature in fully cooled slag-line cupolas. Importance of air velocity at tuyeres. Evolution of conical shell design; theoretical explanation of behavior encountered with fully cooled melting zones; size limitations on furnace. Relationships between slag basicity, Si content and metal temperatures; control of carbon pick-up and sulphur removal; heat balance of plant; continuous operation. 18 ref.
(E10a, W18d, 17-51; CI-n)

700-E.* **A Simple Guide to the Use of Exothermic Feeding Compounds in**

the Foundry. G. N. Cherry. *British Foundryman,* v. 51, June 1958, p. 303-307.

Correct use and advantages of exothermic feeders. Relationship between shape and dimensions of riser and casting defects.
(E22q, E22s; 5-60, 9-67, 9-68)

701-E. (Russian.) **Nitrogen in Cast Iron.** L. I. Levi. *Liteinoe Proizvodstvo,* no. 6, 1955, p. 22-25.

Treatment of molten cast iron with nitrogenous compounds (ammonia, cyanamides, ferrocyanamides) which dissociate and release chemically active atomic nitrogen, strengthening the iron. With increased nitrogen content, ferrite disappears, pearlite is stabilized and condensed and graphitic inclusions are disintegrated and dissipated. Greatest increase in strength is observed in common gray iron.
(E25q; CI, *N*)

702-E. An Introduction to Pattern-making in Plastics. H. G. C. King. *British Foundryman,* v. 51, June 1958, p. 282-290.

Use of epoxy resins for foundry patterns in British railways shop. Methods and equipment, production of master pattern and molds, small solid patterns and large laminated patterns. (E17; NM-d30)

703-E. Refractories in the Foundry. J. H. Cannon and A. L. Bradley. *Refractories Journal,* v. 34, July 1958, p. 309-317.

Refractory failure caused by physical erosion, chemical composition and slag attack, characteristics of Al and MgO, brick, monolithic linings. 8 ref.
(E-general; RM-h)

704-E. (German.) **Centrifugal or Die Casting?** *Giesserei Praxis,* v. 14, July 25, 1958, p. 281-282.

Centrifugal casting assures improved mechanical and structural properties. Horizontal and vertical casting at 10 to 3,000 rpm. Influence of case and cross section on quality. (E14, E13)

705-E.* Surface Sinking Defects in Light Sectioned Grey Iron Castings. A. G. Fuller and I. C. H. Hughes. *Castings,* v. 4, June 1958, p. 33-48.

Some factors in reducing incidence of sinking defects are: eutectic composition, high manganese, low sulphur content, no inoculation, high melting temperature, low melting rate, or holding, pouring temperature of 1280° C., proper gating ratio, limiting amount of flow into molds, rapid filling, uniformity of pattern manufacture, use of rigid molds, casting with bosses uppermost. Factors minimizing one defect may increase incidence of another so changes in foundry practice should be controlled. 9 ref.
(E11; CI, 9-71)

706-E. Influence of the Vacuum and Temperature of Superheating on the Structure of Pig-Iron. I. E. Brainin and S. I. Shapovalov. *Physics of Metals and Metallography,* v. 4, no. 1, 1957, p. 91-98. (Translation by Pergamon Institute.)

Previously abstracted from original. See item 558-E, 1957.
(E25q, E10, 1-73; CI)

707-E. Magnesium Treatment of Low-Sulphur Basic-Cupola Iron. G. I. Kletskin. *Liteinoe Proizvodstvo,* v. 9, no. 9, 1957, p. 21-26. (Henry Brutcher, Altadena, Calif., Translation no. 4303.)

Previously abstracted from original. See item 98-E, 1958.
(E10a; CI-a, Mg, AD-a)

708-E. (German.) **Patternmaking.** Heinz Lucas. *Giessereitechnik,* v. 4, June 1958 p. 128-132.

Co-ordination of pattern design and patternmaking with other foundry activities. (E17)

709-E. (German.) **Nonferrous Cast Metal—a Versatile Material.** Gunther Andexer. *Industrie Anzeiger,* v. 80, May 2, 1958, p. 521-523.

The basic metals are: Cu, Zn, Al, Mg. Properties of different alloys and the most adequate casting process. Economic considerations.
(E-general; EG-a38)

710-E. (Book.) **Foundry Manual (Navships 250-0334).** John Varga, Jr., and N. H. Keyser. 291 p. 1958. Battelle Memorial Institute, 505 King Ave., Columbus 1, Ohio. $3. (Available from U. S. Government Printing Office, Washington 25, D. C.)

(E-general)

711-E.* (French.) **Elimination of Microporosity in Defective Castings.** Louis Gascuel. *Pratique des Industries Mecaniques,* v. 44, June 1958, p. 164-165.

Procedure and equipment used in injection into holes of suitable substance, usually a synthetic resin,

followed by heat treatment designed to provide adherence, mechanical strength and corrosion resistance to injected material. (E25q, 9-68)

712-E.* (German.) **Use of Chills in Casting.** J. Tanner. *Giesserei Praxis,* v. 12, June 25, 1958, p. 239-242.

Chill iron casting process is particularly adaptable to nonuniform thicknesses, high stress values, fine grain structures and hardness of Brinell 180-220 for component parts of machine tools. Chills are not preheated and are used repeatedly. They are treated with mixture of fuel alcohol, colophane and graphite powder before utilization to insure longevity. Examples include castings of 4 to 6 tons with wall thicknesses up to 80 mm. (E22r; CI)

713-E.* (German.) **Cooling System for Dried Quartz Sand.** Karl Haake. *Giessereitechnik,* v. 4, June 1958, p. 123-124.

Sand is oven-dried and a conveyor transports it to a cooling tower in which water is circulated. Inside is a zigzag pipe through which the sand slides. Temperature depends on outside air and cooling water temperatures. Temperature measurements at different times were: entering sand temperature 40 to 60° C.; final sand temperature 18 to 25° C. Capacity of the cooler is 900 liters per hr. The cooling tower uses 1800 liters per hr. of water at 15° C. (E18b)

714-E.* (German.) **Basic Technology of the Elimination of Micro-Porosity by Impregnation With the Thermosetting Epilox-Adhesive M 26.** H. Grosch and B. Hildebrand. *Fertigungstechnik,* v. 8, June 1958, p. 266-267.

Preparation and properties of the adhesive. Cleaning and degreasing of parts to be impregnated (e.g., pressure resistant castings). Impregnating by simple infiltration, by pressure or vacuum, by a combination of pressure and vacuum, and by application of ultrasonics. Health protection. (E25q; NM-d30)

715-E.* (German.) **Sand Mold Casting of Magnesium Alloys.** Hans Haensch. *Giesserei Praxis,* v. 12, June 25, 1958, p. 235-239.

Mechanical properties of cast pieces depend on mold, filling capacity, mold construction, and type of sand and slab used. Adequate proportions of water, sulphur, flowers of sulphur, boric acid, and absence of burnables in Kaiserslautern sand assure desired quality in green-mold casting. Crush, color and X-ray tests conducted on ordinary and heat-treatable Mg alloys shed light on behavior of surface finish, grain formation, stress and piping of castings. Steel molds of special design produce required strength in cast structures. (E11; Mg-b)

716-E.* Some Experiments on Methods of Production of Nodular Cast Iron. S. N. Anant Narayan and S. Visvanathan. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 136-141.

Effects of chloride additions, especially calcium and barium chlorides, to molten cast iron. Results are negative in that the graphite structure is not altered from the normal flaky type to the spherulitic variety. Various methods of adding the agents, experiments to try the feasibility of reducing the chlorides by Al and changes in the composition of the base iron met with no success. Concluded that the production of nodular cast iron by calcium chloride treatment is open to severe criticism. 17 ref. (E25q; CI-r)

717-E.* Why and Where to Use Centrifugal Castings. Pt. 2. Nonferrous Castings. John L. Everhart. *Materials in Design Engineering,* v. 48, Sept. 1958, p. 93-95.

Properties of some alloys used for centrifugal castings; properties of static and centrifugally cast Cu alloys compared; centrifugal castings of Ni, Monel, S-monel, H-monel, G-nickel, Si-Ni, Inconel and silicon Inconel. 4 ref. (E14, Q-general; Cu-b, Ni-b)

718-E.* Effect of Temperature and Atmosphere on Iron-Silica Interface Reaction. G. A. Colligan, L. H. Van Vlack and R. A. Flinn. *Modern Castings,* v. 34, Sept. 1958, p. 54-60.

Variables affecting the reaction are the compositions of metal and sand, pouring temperature and casting cooling rate, metal pressure and the mold atmosphere. Mechanism of mold attack analyzed. Severity dependent upon temperature, time and oxidation. 11 ref. (E11; 9-71, 2-61)

719-E.* Reduction of Silica in Large Shell Molds. L. H. Van Vlack, R. G. Wells and W. B. Pierce. *Modern Castings,* v. 34, Sept. 1958, p. 61-67.

Surface finish, porosity (as influenced by pouring temperature), section size, carbon content, alloy additions, mold composition. 44 ref. (E16c)

720-E. Sodium Silicates for the CO_2 Process. E. A. Lange and R. E. Morey. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 131642, Apr. 1958, 19 p. $.50.

Sands mixed with sodium silicate solutions can be hardened by exposure to carbon dioxide in a matter of seconds. This is an important advantage over conventional methods requiring hours of baking time. Parameters which may be applied directly to the practical application of the CO_2 process. Strength characteristics of the sand mixture related to composition of the sodium silicate solution. Evaluation of such factors as mixing order, CO_2, flow rate and drying techniques. (E18p)

721-E.* (German.) **Formation of Pores and Blisters in Zinc Die Castings.** K. Ruttewit. *Metall,* v. 12, Aug. 1958, p. 713-721.

Prerequisite for a minimum of these defects is a properly pure Zr alloy. Remelting of rejected parts is therefore not advisable. Overheating of melt produces gas porosity. Use of tray risers to eliminate froth. Elimination of old nonmetallic crucibles to avoid penetration of fuel combustion gases through bottom. 46 ref. (E13; Zn, 9-68)

722-E.* (Swedish.) **Surface Roughness of Iron Castings From Sand Molds.** Olof Carlsson. *Gjuteriet,* v. 48, Aug. 1958, p. 111-115.

Surface tension of liquid iron, its contact angles with sand particles, size of pores in mold wall and the size of sand influence surface roughness. Percentages of powdered coal and dextrin not critical. Coal dust important, to avoid iron oxide that would cause contact angles near 0° and penetration of iron into sand rough surfaces. (E11, E18r; CI)

723-E. Casting Defects. J. R. Park. *Foundry Trade Journal,* v. 105, Aug. 28, 1958, p. 257-260.

Various defects, functions of metal and melting; sand and molding material; molding practice; patterns; design. (E11; 9-68, 9-69)

724-E. Design of Die-Castings. Pt. 8. Designing Die-Castings for Easy Finishing. H. K. Barton. *Metal Industry,* v. 93, Aug. 15, 1958, p. 136-138. (Conclusion.)
(E13, L-general; 5-61, 17-51)

725-E. Some Aspects of Modern Aluminum Casting. L. Fletcher. *Metal Industry,* v. 93, Aug. 15, 1958, p. 129-132; Aug. 22, 1958, p. 149-151.
(E13; Al)

726-E. What Is Preventive Maintenance? J. M. Abernath. *Modern Castings,* v. 34, Sept. 1958, p. 20-21.

Preventive maintenance defined and described from several standpoints. (E-general, W19, 18-71)

727-E. Centrifugal Pumps Prime Preventive Maintenance. Robert E. Jacoby. *Modern Castings,* v. 34, Sept. 1958, p. 24-25.

Pumps are key to auto foundry's sand reclamation system designed for minimum maintenance expense. (E18s)

728-E. Saving Through Preventive Maintenance. Chicago Hardware Foundry Co. S. A. Simonson. *Modern Castings,* v. 34, Sept. 1958, p. 26-28.
(E-general, W19; 18-71)

729-E. Saving Through Preventive Maintenance. Electric Steel Foundry Co. Les Wittmayer. *Modern Castings,* v. 34, Sept. 1958. p. 29.
(E-general, W19; 18-71)

730-E. Saving Through Preventive Maintenance. Stanton Iron Works Co., Ltd. J. I. Blackbourn. *Modern Castings,* v. 34, Sept. 1958, p. 30-34.
(E-general, W19, 18-71)

731-E. Die and Permanent Mold Casting of Non-Ferrous Metals in the United Kingdom. L. J. Brice and G. A. Broughton. *Modern Castings,* v. 34, Sept. 1958, p. 68-81.
(E12, E13; EG-a38)

732-E. Study of High Temperature Properties of Shell Molds. R. A. Rabe. *Modern Castings,* v. 34, Sept. 1958, p. 86-96.

Results of tests using bank sand, round and angular grain silica sand and 4-6% resin. Optimum composition and procedures. (E16c; 2-63)

733-E. Construction of Shell Mold Patterns and Core Boxes. Wayne A. Wright. *Modern Castings,* v. 34, Sept. 1958, p. 97-98.
(E16c)

734-E.* (German.) **Improvements in the Mechanical Properties and Machinability of Cast Iron by Magnesium Treatment and Annealing.** Bruno Beyer and Hellmuth Seliger. *Giessereitechnik,* v. 4, July 1958, p. 153-158.

Three cast irons of almost the same percentage of C (2.98 to 3.35%) and Si (1.59 to 1.81%) but different P content (0.21 to 0.66%) are treated with Mg-Si-Fe alloy to add 0.2 to 0.3% Mg of heat weight. On annealing, the cementite decomposed in proportion to annealing time. Tensile strength and notch impact strength improved. Best machinability obtained with ferritic structure and no cementite. 17 ref. (E25, Q-general, G17k, 2-60, 2-64; CI)

735-E.* (German.) **Cupola Practice in the USSR.** L. M. Marienbach. *Giessereitechnik,* v. 4, July 1958, p. 159-161.

The problem of how to adapt cupola practice to high tapping temerature and continuous service. Current solutions such as increasing the radiation heat by high valve fuels (e.g., coke briquets) preheating the air blast and use of oxygen. 26 ref. (E10a)

736-E. (German.) **Economy by Exactly Dimensioned Precision Castings.** W. Schumacher. *Industrie Anzeiger,* v. 80, May 2, 1958, p. 519-520.

With precision cast small parts, finishing operations can be reduced to a minimum if the molds are formed very accurately. (E15, 17-53)

737-E. (German.) **Zinc Die Casting Is Advancing.** K. Baver. *Metall,* v. 12, Aug. 1958, p. 758-759.

Progress in Europe and U. S. Applications in the manufacture of nameplates, tail-light frames, small motor casings, electrical meters, etc. (E13, T-general, 17-57; Zn)

738-E.* **Melting Practice for Aluminum Casting Alloys.** William N. Brammer. *Modern Castings,* v. 34, Oct. 1958, p. 31-36.

Guide to casting techniques. 10 ref. (E-general; Al-b)

739-E.* **Cast Die Cavities. Pt. 3.** Irwin Lubalin. *Precision Metal Molding,* v. 16, Sept. 1958, p. 56.

Disadvantages of the Shaw process weighed against future prospects and growth. Offers rapid economical way of producing die-casting dies and replacement cavities as well as trim dies and machining fixtures and offers possibility of vastly improved die life. (E13, W19n)

740-E. **Investigation of Nodular Cast Iron Manufactured in the Springfield Armory Casting Laboratory.** Olgierd Lubinkowski. U. S. Armory, Springfield, Mass. *U. S. Office of Technical Services,* PB 131399, May 1957, 45 p. $1.25.

Use of Mg-Si as inoculant in preparation of thin-wall, hypereutectic iron. Other addition agents, such as ferromanganese, tellurium, Lanceramp, and ferrosilicon evaluated for producing an iron with fully pearlitic structure and restricted carbide.
(E25q; CI-r, AD-p36)

741-E. **Alloying and Heat Treatment of Ductile Cast Iron. Massachusetts Institute of Technology.** *U. S. Office of Technical Services,* PB 131350, Aug. 1955, 97 p. $2.50.

Basic variables involved in risering ductile iron castings; effect on shrinkage. The amount of gross feed metal required depended upon carbon content, Si content, pouring temperature and rigidity of mold. Large sprues and flow-offs are sufficient to act as risers and feed the casting. Sponge shrinkage was eliminated by observing the following relationship. The % carbon + 1/7% silicon = 3.9%. Cutting of ductile iron; machining forces measured and analyzed.
(E22q, G17, J-general; CI-r)

742-E.* (German.) **Improved Cast Surfaces and Higher Production by the Use of Core Materials With Increased Flow Properties.** Ernst Wunderlich. *Giessereitechnik,* v. 4, July 1958, p. 169-172.

Good surfaces were obtained with cores made with oil binders and sands of grain sizes < 0.06 to < 0.3. This material suited for balanced cores up to 12 cm. in height, for cores made in jolting machines and for cores up to 15 cm. diameter. (E21g)

743-E.* (German.) **Processes for the Improvement of Various Properties of Cast Aluminum-Magnesium Alloys.** Hermann Kessler. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 312-316.

A new grain refining process for cast Al-Mg alloys was developed, introducing carbon chloride vapor into alloys containing Ti, B and Be by means of a carrier gas such as nitrogen. Through a reaction with carbon, titanium carbide and titanium diboride are formed which effect a particularly refined structure through the formation of nuclei.

Chlorine gas in nascent state contributes to purification and degassing of melt. Yield strength, elongation, hardness, Charpy impact strength and fatigue strength are improved. (E25q, E25s; Al, Mg)

744-E.* (Russian.) **Vacuum Pressure Die Casting.** M. L. Zaslavskii. *Liteinoe Proizvodstvo,* July 1958, p. 6-8.

Application of vacuum pressure to eliminate porosity in castings has shown many other advantages. It provides stronger, cleaner surfaces and reduces waste by 15%. It has largely eliminated cracks in casting Mg alloys and increased strength of Zn alloy castings by 19%. (E13, 1-73; Mg, Zn)

745-E.* (Russian.) **Nonferrous Metal casting in Plaster Molds.** V. G. Baradan'yants. *Liteinoe Proizvodstvo,* July 1958, p. 9-11.

Advantages of casting in plaster molds as against precision investment casting are that it can handle much larger thin-walled objects as well as parts with narrow cavities. It is necessary to use high-strength alpha-plaster which hardens slowly. Its preparation requires a 6 to 8-hr. treatment of calcium sulphuric acid in vapor at 1.2 to 1.3 atm. pressure followed by drying for 8 to 10 hr. at 120 to 124°. (E16a)

746-E.* (Russian.) **Hot Cracking Resistance of Cast Steel and Method of Increasing It.** N. S. Kreshchanovskii and M. P. Demin. *Liteinoe Proizvodstvo,* July 1958, p. 17-21.

Hot cracks form primarily at the crystal boundaries. The main factor determining the crack-resistance of steel is the character of the intercrystalline bonds which are determined by the substances entering into steel composition. Of particular importance is the surface activity of these elements. Admixtures which are introduced during the crystallization process, having the effect of reducing surface activity and increasing surface tension, will contribute to reducing hot cracks. Introduction of 3% Ti has proven to be most effective means of reducing surface activity and cracks. 30 ref. (E25q, 19-72; ST, Ti, AD-p)

747-E.* (German.) **Gray Cast Iron and Steel Scrap.** J. Tanner. *Giesserei Praxis,* no. 15, Aug. 10, 1958, p. 291-293.

Steel scrap additions (up to 25%) improve quality and appearance of gray cast iron. Careful preparation (calculation of composition, analysis and mechanical tests) performed on steel scrap used. (E11; ST, CI-n, RM-p)

748-E. Gas-Turbine Castings. P. V. Brown. *Aircraft Production,* v. 20, Sept. 1958, p. 337-342.

Recent developments in foundry techniques; use of epoxy resins in making pattern equipment. (E17, W11n)

749-E. Improvement of Cast Iron by Oxygen Blowing. Ichiro Iitaka and Kokichi Nakamura. *Foundry Trade Journal,* v. 105, Sept. 11, 1958, p. 313-314.

Results of tests using oxygen injection as a substitute for steel scrap to lower Si and C content when making cast iron from remelted pig iron. (E25; CI)

750-E. Recent Developments in the Manufacture of Castings. J. L. Rice, R. W. Ruddle and P. A. Russell. *Institution of Mechanical Engineers, Proceedings,* v. 171, 1957, p. 133-160. (E-general)

751-E. Casting or Forging? *Light Metals,* v. 21, Sept. 1958, p. 276-278.

Comparison of properties, costs, methods of casting and forging light metals. (E-general, F22; Al, Mg, Ti)

752-E. Frozen Mercury Investment Casting. *Mass Production,* v. 34, Sept. 1958, p. 92-98.

Mercast process has been introduced to England by Sankey-Telcon Ltd. (E15)

753-E. The Mercast Process. *Metal Industry,* v. 93, Aug. 1, 1958, p. 93-96.

Precision investment casting by the Mercast process, which uses frozen mercury as the pattern material. (E15)

754-E. We Cast the Impossible. R. H. Osbrink. *Modern Castings,* v. 34, Oct. 1958, p. 22-25.

High-precision light metal castings made by use of extreme care, high-quality cores and molds in Osbrink process. (E-general; Al, Mg)

755-E. Controlling C, H_2, O, N in Steel Melting. F. E. Van Voris. *Modern Castings,* v. 34, Oct. 1958, p. 28-30, 120-123.

Effect of various deoxidants, addition agents, and removal of common gases from molten steel. 16 ref. (E25s; ST, *O, N, H*)

756-E. Duplexing Pays at Automotive Foundry. H. A. Laforet and F. J. Webbere. *Modern Castings,* v. 34, Oct. 1958, p. 37-40.

Under favorable circumstances the duplexing of cylinder iron can show a net cost advantage if used to its full potential. Duplexing allowed major improvement in cupola practice and metal transfer operations. (E10a, T21b; CI)

757-E. Aluminum Melting Practice in the Die Casting and Permanent Mold Fields. J. P. Moehling. *Modern Castings,* v. 34, Oct. 1958, p. 67-77.

General properties of Al, fluxing, porosity, melting furnaces. (E13, E12; Al)

758-E. Sand Castings Are Expensive. *Precision Metal Molding,* v. 16, Sept. 1958, p. 55, 60.

Switching from a sand cast hinge to a permanent mold cast hinge resulted in a decrease in machining costs and weight, and reduced inspection costs, handling and rejects. (E11, E12)

759-E. (Russian.) **New Foundries in Heavy Machinery Plants.** P. N. Bidulya. *Liteinoe Proizvodstvo,* July 1958, p. 1-2.

Installation of new mechanized foundry equipment has made it possible to turn out much larger castings while sharply reducing the cycle of production. Greater precision in casting parts has resulted in large savings of machining time. 6 ref. (E-general, W19, 18-74)

760-E. (Russian.) **Runner System Dimensions in Pressure Die Casting.** A. K. Belopukhov. *Liteinoe Proizvodstvo,* July 1958, p. 3-6.

6 ref. (E13, E22)

761-E. (Russian.) **Structure Formation at High Cooling Rate of Melt.** I. V. Salli. *Liteinoe Proizvodstvo,* July 1958, p. 22-25.

Decisive effect of speed of cooling on metal structure. Method of increasing cooling rate during crystallization of alloys. 8 ref. (E25q, 2-61, 3-67)

762-E. (Book.) **Introduction to Foundry Technology.** D. C. Ekey and W. P. Winter. 296 p. 1958. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York 36, N. Y. $7.

Foundry theory and practice for the engineering student. (E-general)

763-E.* Casting Iron Patterns in Zircon Sand. C. W. Yaw. *Foundry,* v. 86, Oct. 1958, p. 74-75.

Reduced machining not only cuts costs but leaves the pattern with a good wearing surface. (E17; CI, NM-f45)

764-E.* Shrinkage Prevention in Bronze Castings. Clyde L. Frear. *Foundry,* v. 86, Oct. 1958, p. 84-89.

Correct use of risers, pencil gates, runners, chills and padding to insure sound castings. Optimum pouring technique. (To be continued.) (E22; Cu-s)

765-E.* (French.) **New Hot Blast Cupola With Direct Recovery of Heat From Charging Hole Gases.** Georges Ulmer. *Fonderie,* June 1958, p. 263-272.

Inexpensive recuperator is mounted directly over charging hole, also acts as stack, combustion chamber and heat exchanger. Design and operation based on fact that charging hole gases contain, under average conditions, about 50% of heat produced by coke consumed, and that, to heat air required for combustion of coke to 400° C., for example, it suffices to recover only a third of sensible and latent heat from these gases. Use of this device reduced coke consumption, increased output of cupola formerly operated on cold blast. Good metallurgical results are obtained, as well as flexibility of operation. 8 ref. (E10a, W18d)

766-E.* (French.) **Contribution to the Study of Sprue Requirements in the Steel Foundry. Testing of a Simplified Method of Sprue Design Applied to Case of Three Rims.** Marcel Jaumain. *Fonderie,* June 1958, p. 273-278.

Sprues for rims of different dimensions were calculated by method described by Bishop, Myskowski and Pellini in *Transactions* of American Foundrymen's Society. Finished castings were sound except for a few minute flaws attributed to sand inclusions. These applications, plus others previously made, confirm validity of method. (E22; ST)

767-E.* (French.) **Special Stoving Processes. Use of Infrared Radiation for Mold Drying and Core Baking.** *Fonderie,* June 1958, p. 283-287.

Surface and internal temperatures of molds being dried by gas or electrically produced infrared radiation; depth and degree of drying as function of power of emission and duration of exposure. Gas-heated

ovens gave best results. Cores over 50 mm. thick were not successfully baked by infrared radiation alone, but good results were obtained by combination of radiation and convection. Gas is favored over electricity for both jobs because of high emissive power, more uniform radiation and relatively low cost. (Concluded.) (E19, E21h; RM-m)

768-E.* (German.) **Nonferrous Melting Practice.** W. Schröder. *Giesserei-Praxis,* no. 16, Aug. 25, 1958, p. 311-315.

Six important alloys, their characteristics, individual melting procedures in types of furnaces. Operation of furnaces, introduction of raw materials and skimming of slags. Alloys discussed are tin bronze, red brass, brass, aluminum bronze, lead bronze, and lead-tin bronze. (E10; Cu-b)

769-E.* (Italian.) **Materials and Techniques Used in the Preparation of Molds and Cores in the Brass Foundry.** L. Alladia. *Fonderia Italiana,* July 1958, p. 256-258, 264.

Sand, clay, metal, plaster and wax as mold materials; casting techniques in which molds made of these materials can be used; binders and additives. Selection of sand and binders for cores; coremaking by shell molding and CO_2 processes; baking. (E18, E19, E21; Cu-n)

770-E.* (Russian.) **Centrifugal Casting of Iron Water Pipe in Sand Molds.** Z. A. Grinberg. *Metallurg,* v. 3, Aug. 1958, p. 31-33.

Process is based on principle that the metal, solidifying in the mold, thickens considerably as result of the centrifugal force. Wall thickness of pipe produced by this method is 20% less, while length of pipe is 1.5 times greater than by usual methods, resulting in considerable saving of metal. (E15; CI, 4-60)

771-E.* (Spanish.) **Oxygenation of Gray Cast Iron.** Arturo Arasti. *Instituto del Hierro y del Acero,* v. 11, Apr-June 1958, p. 91-96.

Laboratory experiments demonstrated possibilities of controlling Si content of gray iron castings by injection of oxygen in ladle, without disturbing percentages of other elements in molten metal. Pressure and duration of injection have important effect on ultimate Si content. Pouring with a siphon ladle is recommended to separate highly fluid slag resulting from oxygen treatment. Specially designed injection device. 8 ref. (E23, E25, W18g; CI-n)

772-E.* (German.) **Factors in Synthetic Molding-Sand Preparation.** A. Hohmann. *Giesserei-Praxis,* v. 18, Sept. 25, 1958, p. 365-366.

Properties of molding sand can be changed by preparation. Influencing factors are water content, amount of clay, viscosity of the clay, smoothness of the clay layer surrounding the sand grain, relationship between preparation time and firmness, volumetric weight, compressibility. (E18)

773-E.* (Rumanian.) **Study of Factors Determining Grain Size in Magnesium Alloys.** Georgeta Dan and Aurelia Protopopescu. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 21-36.

Fine grain gives superior properties and better heat treatment. Tests showed the influence on grain size of chemical composition, progress of melting and introduction of substances capable of separating out carbon. Mn and Zn have almost no influence while aluminum has a distinct grain-refining effect. Super heating from 750 to 1050° produces a finer grain, the higher the temperature. Longer stays at lower temperatures partly compensate the effect of higher temperatures. Similar result also obtained by inoculation with methane or butane gas at lower temperatures (750-800° C.). This is a simple and economical method to obtain fine grain. 11 ref. (E25q; Mg)

774-E.* **The Ejection of Deeply-Cored Die Castings.** H. K. and L. C. Barton. *Machinery (London),* v. 93, Sept. 24, 1958, p. 723-733.

Problems associated with ejecting castings produced from deep cavities. Line drawings of typical push-rod and hydraulic cylinder ejection mechanisms, also of cores arranged for withdrawal by a finger cam and variations in wall thickness which can result from slight displacement of the core. By use of a retractable core arranged to slide in the direction of die travel, improved accuracy can be obtained. Dies arranged to be displaced transversely prior to the ejection of the castings and difficulties associated with die castings which incorporate long steel inserts. (E13)

775-E.* (German.) **Structure and Properties of Aluminum Castings With Inclusions.** A. G. Spasskij. *Freiberger Forschungshefte,* v. B24-3, July 1958, p. 7-18.

Inclusions may form if the Si in SiO_2 is replaced by Al. This reaction is favored by the use of a borax, cryolite or fluoride flux, while it is hindered by chlorides, especially barium chloride. It is eliminated by applying a chalk layer to the clay lining or by using magnesite or chromium magnesite linings. Changes in structure explained by invisible, equally distributed foreign materials. (E25q; Al, 9-69)

776-E.* (German.) **Shrinkage of Magnesium-Treated Cast Iron.** K. I. Wastschenko, R. P. Todorow and and W. W. Shishtschenko. *Freiberger Forschungshefte,* v. B24-3, July 1958, p. 47-83.

Cast iron with 3.23% C, 3.04% Si, 0.60% Mn, 0.084% P, 0.008% S, 0.045% Mg held at 1350° C. showed an increase of shrinkage properties by a gradual loss of Mg. Influence of Si and P and of cooling rate. Cavities favored by Mg, C, hindered by Si. 15 ref. (E25n, 2-60; CI, *Mg*)

777-E.* (German.) **Investigations on Cupola Furnaces.** Wilhelm Patterson. *Giesserei,* v. 45, Sept. 11, 1958, p. 525-531.

Furnace loss by application of hot blast air thought to be avoidable by choosing a coke of increased density and right size (probably 80-100 mm.), incrusting it with cement and adding calcium carbide. Producing high temperatures by heating the blast air with additional fuel rather than by increasing the coke charge is suggested. (E10a)

778-E.* (German.) **Use of Calcium Carbide in the Cupola Furnace.** Rudolf Schulze. *Giesserei,* v. 45, Sept. 11, 1958, p. 542-545.

Addition of 2-3% calcium carbide to raise the temperature in the zone above the tuyeres by more active coke combustion. The amount of calcium carbide added depends on the kind of iron or steel melted. Advantages are one-quarter less coke consumption, reduced amount of S in the iron, improved furnace efficiency, hotter iron and hotter slag, increased Si and C, faster starting of furnace. (E10a, E25r; CI)

779-E.* (German.) **Service Behavior of Clay-Bound Green Molding Sands.** Wilhelm Patterson and Dietmar Boenisch. *Giesserei,* v. 45, Sept. 11, 1958, p. 565-567.

In green sand molds, a moisture zone of lower strength forms under the sand surface. The strength of this moisture zone is measured by a new method. As a result sand expansion defects in castings can be prevented. (E18r, E19a)

780-E.* (German.) **Water Glass as Binder in Molding and Core Sands.** F. W. Nield and D. Epstein. *Giesserei,* v. 45, Sept. 11, 1958, p. 567-575.

Experiments with quartz sand "Redhill F" and water glass in a weight proportion of SiO_2 to Na_2O from 2.0 to 3.3. In CO_2 treatment water glass with proportion of 2.0 gave highest compressive strength of mold. The smaller the proportion of SiO_2 to Na_2O, the longer the time required for CO_2 treatment; however, strength was improved. (E18n)

781-E.* (German.) **Shrinkage of Aluminum Alloys in Sand Casting.** Hans Reininger. *Giesserei Praxis,* no. 17, Sept. 10, 1958, p. 326-337.

Seven Al alloys, chlorinated and unchlorinated, studied for surface and subsurface defects and hot tears. Two kinds of solidification—simple shell and skeleton-type—with different crystal formation, influence defect formation. Importance of temperature during casting (uneven distribution of heat favors defect formation: and solidification (freezing sensitivity). 27 ref. (E25n, E11; Al)

782-E.* (German.) **Synthetic Resins and Their Use in Foundries.** *Giesserei Praxis,* no. 17, Sept. 10, 1958, p. 338-339.

Synthetic resins used increasingly in patternmaking. Many have good mechanical properties, moisture and aging resistance, excellent adhesion on metals and stability. Advantages in general: quick and cheap to produce; unlimited capacity for copying; little wear. Care must be exercised during production because of tension sensitivity, lower fatigue limit and temperature dependence. Production of synthetic resin patterns. (E17)

783-E.* (Japanese.) **Recent Electrolytic Advances in Preparation of Molds.** N. Kinoshita.. *Metals,* v. 28, Sept. 1958, p. 694-699.

Electrodeposited metal layer on an electrode can be peeled off to make a replica of such things as optical diffraction gratings, records, objects of art, typographical plates, radar parts, jet engine parts and Venturi tubes. Thickness of deposited layer is 10^3 times that of plating. Speed of deposition is 0.1 to 2 mm. per hr. Cu, Ag, Ni, Fe, Co, Au, Zn and W alloys can be deposited. (E19)

784-E. Investment Casters Push Ceramic Shell Use. Ted Operhall. *Foundry,* v. 86, Oct. 1958, p. 68-70.

Commercial production of castings in ceramic shell molds has shown a number of advantages over use of investment molds. (E19c)

785-E. A Brass Foundry Can Have Good Working Conditions. William G. Gude. *Foundry,* v. 86, Oct. 1958, p. 76-79.

Sand preparation, molding, melting, pouring and shakeout operations. (E11, 18-67; Cu-n)

786-E. Quality Control Tests in the Shell Process. Earl W. Jahn. *Foundry,* v. 86, Oct. 1958, p. 80-81.

Checking the physical characteristics of shell molded castings and sand mixes can be simplified by use of a standard pattern to produce test castings and molds for making sand specimens. (E19c)

787-E. Mechanized Molding Matches Manual Skill. *Metalworking Production,* v. 102, Oct. 3, 1958, p. 1727-1732.

Molding and pouring are completely automatic in this installation. Only core setting remains a manual operation. Sand, mold density, flask filling, flask design. (E19, E21, 18-74; CI-s)

788-E. Interim Report on Vacuum Die Casting. *Precision Metal Molding,* v. 16, Oct. 1958, p. 62-63.

Advantages and disadvantages of the vacuum process. (E13, 1-73)

789-E. A New Hot Blast Cupola With Direct Recuperation of the Heat of the Exhaust Gases. G. Ulmer. *International Foundry Congress, Stockholm,* Paper no. 26, Aug. 19-24, 1957, p. 643-668. (British Cast Iron Research Assoc., Alvechurch, Birmingham, Translation no. 839.)

795-E. (Italian.) **The New G. Fischer Foundry.** *Fonderia,* v. 7, Aug. 1958, p. 337-342.

Completely automated foundry in Shaffhausen, Switzerland, designed by American and Swiss engineers, has two operating units, can produce 36,000 tons of malleable iron castings per year with labor force of only nine men involved in direct operations. Two automatic forming units produce a maximum of 300 complete forms per hr., or one every 12 sec. Facilities and procedures. (E11, W19; CI-s)

796-E. Mechanical Properties of Die-Cast Irons. G. K. Gedevanishvili and R. B. Zvenitskaya. *Liteinoe Proizvodstvo,* no. 3, Mar. 1958, p. 10-11. (Henry Brutcher, Altadena, Calif., Translation no. 4336.)

Previously abstracted from original. See item 384-E, 1958.
(E13, 3-74; CI)

797-E. Casting Uranium-5% Zirconium-1.5% Niobium Alloys Into Zirconium and Zircaloy-2 Containers. J. W. Frank and R. E. Macherey. Argonne National Laboratory. *U. S. Atomic Energy Commission ANL-5442,* July 1958, 50 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Uranium and high-uranium alloys are bonded to Zr and Zr alloys by a direct casting method. Unalloyed U and U alloyed with 5% Zr and 1.5% Cb were cast into Zr and Zircaloy-2 molds of various shapes and sizes. Castings made in cans of circular cross section were well bonded and sound, provided the molds were out-gassed at elevated temperature before use and proper preheating precautions were observed. 9 ref. (E16, L22; U, Zr)

798-E. (Czech.) **Structural Changes on Casting Stainless Steel.** S. J. Maresh Skala. *Ceskoslovenska Stomtologie,* no. 2, 1957, p. 57-65.

Stainless steels with 18% Cr and 8% Ni, or with 14% Cr and 8% Ni, are used in dentistry. Increased content of C and inhomogeneity of structure produce brittleness and low corrosion stability of the steel. The present method of melting by electric arc leads to an increased C content, whether the usual or high-grade electrodes are used. The amount of carburization increases with rapid melting. A low C content was achieved only by autogenous (gaseous) melting. Structural inhomogeneities arising on casting were removed by annealing at 1150° for 2 hr. and subsequently quenching in water.
(E10, T10e, 17-57; SS)

799-E.* (German.) **Reasons for "Gassing" of Aluminum Castings.** H. Kessler. *Aluminium,* v. 34, Sept. 1958, p. 518-521.

Porosity of Al castings caused by hydrogen from combustion gases of the fuel or atmospheric moisture. Presence of hydrogen tested by putting a crucible with melt in a receptacle and slowly exhausting the air. Hydrogen, if present, changes surface appearance after solidification and cavities are found after sawing. Best way to remove hydrogen is to slowly supply chlorine in a "converter" or by carbon pipes under the surface. (E25s; Al, 9-68)

800-E.* (German.) **Dimensioning of Feeder Heads and Risers.** W. Koppe. *Giesserei,* v. 45, Aug. 14, 1958, p. 469-474.

General formula for computation of volume riser plus feeder head. Coefficients for different shapes of castings and different materials evident from tables. For cast iron, special correction factors taken into consideration because of the expansive precipitation of eutectic graphite. Dimensioning of gates.
(E22; CI)

801-E.* (Japanese.) **Molding Techniques in the Soviet Union.** *Metals,* v. 28, Oct. 1958, p. 769-771.

The most significant contributions are oxygen blow into the melting furnace, application of isotopes and gaseous molds. (E10, E19, 1-59)

802-E. Vacuum Die Casting Saves on Machining. *Design Engineering,* v. 4, Sept. 1958, p. 45-47.

Steps followed by Aurora Metal for vacuum die casting of aluminum bronze and silicon bronze.

813-E. (Russian.) **Improving Technology of Melting Alloys in Electric Furnaces.** A. F. Kablukovskii, Ya. S. Leizerov and I. P. Solodikhin. *Metallurg,* v. 3, Sept. 1958, p. 12-15.

Melting of Ni and Fe-base alloys of specific electrical resistance, Nichrome and Fe-Cr-Al alloys. Investigation conducted to reduce high labor expenditure, high spoilage rate and increase annual output. Production of Cr-Al alloy containing no more than 0.03% C and no more than 0.40% Si solved many difficulties. (E10r, Al, Cr, Fe, Vi)

814-E. (Russian.) **New Method of Metal Alloy Preparation.** G. I. Pogodin-Alekseev and V. V. Zaboleev-Zotov. *Liteinoe Proizvodstvo,* July 1958, p. 25-26.

Effect of ultrasonic waves on formation of hard alloys. Relation between changing frequencies of ultrasonic waves and uniformity and hardness of cast alloys. (E25, 1-74)

815 E.* Design of Cast Components. H. G. Goyns. *Engineer and Foundryman,* v. 23, July 1958, p. 54-66.

Mechanism of solidification, shrinkage and cooling stresses in cast steel and cast iron. (E25n; ST, 5-60, CI)

816-E.* (Russian.) **Effect of Pressure of Inert Gas in Melting Furnaces Upon the Gas Content of Molten Metal.** D. S. Kamenetskaya and A. N. Zelenov. *Metallovedenie i Obrabotka Metallov,* v. 4, Sept. 1958, p. 27-28. (Henry Brutcher, Altadena, Calif., Translation no. 4353.)

Experiments conducted under vacuum and compared with results of inert gas atmosphere, using as test specimen Chromel melted in high-frequency induction furnace, without slag or deoxidizers (magnesite brick lining). By prolonging exposure of liquid metal in inert gas atmosphere, the gas content in the metal declines. By increasing the pressure of inert gases, an increase of gas content takes place. (E25s)

817-E.* Austenitic Manganese Steel. Hedley Thomas. *Castings,* v. 4, Sept. 1958, p. 13, 15, 17, 19, 21, 23.

Techniques employed in an Australian foundry. Melting; ladles and pouring; molds and cores; heat treatment; cleaning of castings; chemical control; physical testing; metallography. Two methods of manganese determination. (E11; AY, *Mn*)

818-E.* Radio Isotopes and Their Use in the Foundry. F. C. Pollard. *Castings,* v. 4, Sept. 1958, p. 25, 27.

Radio-tracer technique and photographic effect; use of beta and gamma rays in determining thickness. (E-general, 1-59, S14e)

819-E.* Precision Cast Aluminium Wave Guides. *Light Metals,* v. 21, Oct. 1958, p. 313-316.

Mercast process for manufacture of wave guide components requiring light weight, extreme accuracy of internal dimensions, dimensional stability, absence of porosity and surface defects, fine surface finish, minimum of costly machining proc-

esses, maximum strength.
(E15, X15q; Al)

820-E.* Use of Oxygen in the Malleable Air Furnace. *National Cylinder Gas, Information Report,* no. 14, Aug. 1958, 7 p.

O_2 injected into the pulverized coal-air mixture improves combustion, permits rapid oxidation of unwanted elements, improves slag and metal fluidity. (E10s; O, CI-s)

821-E.* Use of Nitrogen for Flushing Molten Metals. *National Cylinder Gas, Information Report,* no. 19, Aug. 1958, 8 p.

Advantages of N_2 as degassing, oxide removal agent; procedure, equipment, for eliminating porosity from Al castings.
(E25s, 9-68; Al-b, N)

822-E.* NCG Controlled Cupola Chemistry Process. *National Cylinder Gas, Information Report,* no. 13, June 1958, 8 p.

Process for oxygen injection. Advantages claimed include greater output of usable metal, increased alloy recovery, reduced coke consumption, less oxygen consumed.
(E10a; O, CI)

823-E.* (French.) **Cast Steel Chains With High Mechanical Properties.** Maurice Flour. *Fonderie,* no. 150, July 1958, p. 297-301.

Casting techniques and molds used; superiority of cast over welded chain. Suggested that French navy and other users of heavy-duty chain would do well to adopt cast product. (E11, T7e, 17-57; ST)

824-E.* (French.) **Fabrication of Light Alloy Pattern Plates Cast in Plaster Molds.** *Journal d'Informations Techniques des Industries de la Fonderie,* no. 97, June-July 1958, p. 2-7.

Plaster pattern plates formerly used for small-lot manual production were found unsuitable for vibration and pressure conditions of large-lot machine molding. Method was developed for molding light alloy pattern plates directly on plaster master plates having from 20 to 150 very small patterns made of babbitt metal cored into the plaster. Resultant pattern plates are precision products as shrinkage of light alloy is relatively low.
(E19, W19j, 17-57; Al, Mg)

825-E.* (French.) **Central Feeding With Horizontal Cold Chamber Pressure Casting Machines. Molds and Process.** K. A. Ritter. *Machine Moderne,* v. 52, Aug. 1958, p. 71-74.

Tools and techniques which, without requiring any change in mold or machine, permit use on horizontal chamber machines of molds designed for vertical chamber machines. (E13, 1-52)

826-E.* (German.) **Treatment of Aluminum Alloys With Chlorine.** Heinz Scheuten. *Giesserei,* v. 45, Oct. 9, 1958, p. 633-639.

Theoretical discussion of thermodynamic and chemical processes in refining of Al alloys through introduction of chlorine into the melt. Number of possible chemical reactions (with chlorine) is large. Temperature-dependence of reactions can be followed thermodynamically with the Gibbs-Helmholtz equation. Best ways of using chlorine in the gaseous state or as chlorine-releasing salts, for the refinement of Al in the melting process. Excess chlorine may lead to difficult-to-cast metal. 14 ref. (E25s; Al-b)

827-E.* (German.) **Oxygen-Enriched Blast Air in the Cupola Furnace.** *Giesserei-Praxis,* no. 9, May 10, 1958, p. 175.

Advantages: shortening of time between tappings, variable melt temperature, lower coke consumption. Yield increased 3 to 5% by the use of 3-4% additional oxygen.
(E10a)

828-E.* (German.) **New-Type Powder-Flame Cleaning of Castings.** *Giesserei-Praxis,* no. 9, May 10, 1958, p. 176-178.

Cleaning torch combines a fuel-gas-oxygen flame, a current of oxygen and a metallic powder air blast. The Griesheim powder-flame cutter is used in cutting cast iron and steel. Griesheim-powder-lance cleans ingot molds, cuts iron and other alloys as well as slags and refractory materials.
(E24, G22g, L10g)

829-E.* (German.) **Porous Castings Impregnated by the "Moguloid" Process.** *Giesserei-Praxis,* no. 9, May 10, 1958, p. 178-179.

Sealing with Mogul cast seal, a colloidal solution containing metal powder. Before application, the castings are treated by vacuum to remove air from the pores or cavities. Pressure tested at 700 atm., castings sealed by this process resist temperatures up to 400° C.
(E25q, E26, 9-68)

830-E.* (German.) **Spheroidal Graphite Iron.** Karl Kessler. *Industrieblatt,* v. 58, Aug. 1958, p. 363-367.

Heating temperatures and time, as well as cooling conditions, determine resulting properties (ductility, tensile strength, Brinell hardness). Heat treatment used in production of most spheroidal graphite castings. Structures (ferritic, ferritic-pearlitic, pearlitic), and characteristics of each. Welding spheroidal graphite iron, subsequent heat treatment and surface finishing procedures.
(E25q, J-general, K-general; CI-r)

831-E.* (German.) **Progress in the Field of Nodular Cast Irons.** H. Morrogh. *Industrie-Anzeiger,* v. 80, Sept. 12, 1958, p. 20-22.

Pb, Cu, Sb, Bi and Ti, particularly when present in combination, can prevent Mg from having the desired nodulizing effect, but addition of Ce to give a retained Ce content of not less than about 0.002% permits effects of these subversive elements to be neutralized. Use of Ce in presence of Mg is now common practice. (E25q; CI-r)

832-E.* (Swedish.) **Feeding Compounds and Riser Insulation for Steel Casting.** Kurt Beckius. *Gjuteriet,* v. 48, Sept. 1958, p. 127-145.

"Kolfria" (95% silica; 5% oxides of Al, Fe, Ca, Mg and 0.16% P_2O_5), "Kolrika", 18.4-32.3% C; quartz + traces of oxides and metals and mixtures of Al chips, iron oxides, quartz with 0.3 to 1.4% C, or 3.6 to 15.4% respectively, are used in linings surrounding the risers or as a covering on top of the riser, to obtain a thermo-insulating effect that retards solidifying and eliminates piping. 18 ref. (E22q; ST, 9-67)

833-E.* (Dutch.) **Metal-Mold Reaction With Aluminum and Copper Alloys.** H. Boswinkel. *Metalen,* v. 13, June 30, 1958, p. 220-223.

Reaction of molten phosphor bronze or Al alloys containing Mg with the moisture or combined water present in sand molds, and the absorption of the gaseous products by the molten metal. Influence of P, Mg and other alloying elements on the metal-mold reaction and resulting porosity. Effect of pouring temperature, mold temperature and mold material on gas absorption. 10 ref. (E25n, 2-60, 2-61; Al-b, Cu-b, Mg, P, 5-60, 9-68)

834-E.* (Japanese.) **Relation Between Penetration or Blow and Back Pressure of Sand Mold.** Mototaka Mutaguchi. *Japan Foundrymen's Society, Journal,* v. 30, July 1958, p. 541-547.

Mercury used to investigate pressure of penetration or blow and relation between penetration and washes of sand molds. Pressure which caused penetration was inversely proportional to size of sand spacing. Pressure for penetration increased in the presence of back pressure. With back pressure beyond critical range blows occurred regardless of the state of the mold surface. (E19, E11, 3-74; NM-H5)

835-E.* (Japanese.) **Change of Mechanical Properties by Vacuum Melting of Cast Irons. Pt. 1.** Masao Kikuchi. *Japan Foundrymen's Society, Journal,* v. 30, July 1958, p. 553-559.

Flake graphite existing in each pig iron changed to fine eutectic graphite and the pearlitic matrix became ferritic. Tensile strength in general improved. The use of graphite crucibles increased the carbon in the molten iron and resulted in decreased tensile strength and precipitation of coarse flake graphite. 10 ref. (E10p, M27, Q27a, 1-73; CI)

836-E.* (Japanese.) **Some Experimental Studies of Magnesium Nodular Cast Iron by Reducing Refining in the Electric Arc Furnaces.** Masao Homma, Hiroshi Meguro, Yoshihiko Abe and Reiichi Ohno. *Japan Foundrymen's Society, Journal,* v. 30, Aug. 1958, p. 597-602.

In refining of cast iron in acid and basic electric arc furnaces the amount of Mg was smaller than required in cupola. Both types of furnaces gave excellent desulphurizing actions. Annealed castings from basic furnaces had tensile strengths of 40 to 48 kg. per sq. mm. and elongations of 10 to 15% while acid furnace gave same tensile strengths and elongations of 9 to 11%. 10 ref. (E10r, Q17a, CI-r)

837-E.* (Japanese.) **Relation Between Amount of Binder and Permeability.** Mototaka Mutaguchi. *Japan Foundrymen's Society, Journal,* v. 30, Aug. 1958, p. 608-612.

Factors affecting permeability of molds; formula expressing relationship of permeability with packing binders, sand grain size and percentage of sand grains retained. Results of permeability measurements on green and synthetic sand containing various amounts of binders were in good agreement with computed values. (E18r; NM-f45)

838-E.* (Japanese.) **Studies on Step Gates.** Kenji Chijiiwa. *Japan Foundrymen's Society, Journal,* v. 30, Aug. 1958, p. 612-618.

Fluidity of molten metal in castings to which step gates were attached. Effect of pouring rate and sizes of sprue ingate and casting on fluidity. With fast pouring the molten metal flowed back from the casting to sprue through the upper ingate if the diameter of the ingate was smaller than the sprue. This back flow was prevented by using a sprue diameter that was 80% of the diameter of ingate. If the pouring rate was slow the flow back was negligible when the diameter of the sprue and ingate were the same. (E22p)

839-E. **Quality Control of Melting Stock for Investment Founders.** L. S. Taylor. *Foundry Trade Journal,* v. 105, Oct. 16, 1958, p. 467-470.

Influence of tramp elements and vacuum melting on the quality of castings. (E10, 1-73, 3-69; ST)

840-E. **Protective Atmospheres for Teeming Alloy Steel.** P. Holtzhaussen and H. Fiedler. *Iron and Coal Trades Review,* v. 177, Sept. 26, 1958, p. 741-746. (From *Neue Hütte,* v. 2, Nov. 1957, p. 685-691.)

Previously abstracted from original. See item 226-E, 1958. (E23, E25; SS)

841-E. **What the Designer Should Know About Production. Pt. 3. Castings, Casting Design, and Foundry Methods.** Jack M. Tarnow. *Machinery,* v. 65, Nov. 1958, p. 154-162.

(E-general, 17-51, 17-55)

842-E. **Lost Wax Investment Casting.** *Machinery (London),* v. 93, Oct. 22, 1958, p. 941-948.

New precoating material developed for the wax trees, to eliminate "fusion", or "slag spots", which frequently occur when casting Cr alloys of the martensitic type. (E15)

843-E. **Use of the NOG Solid Materials Dispensing Unit in the Treatment of Molten Metals.** *National Cylinder Gas Information Report,* no. 17, Aug. 1958, 9 p.

Used for injecting $CaCO_2$ or other material for desulphurization, carbon, degassing and deoxidation agents; alloy additions into molten metal. Results in more effective use of additive, better metal agitation. (E25; CI-b)

844-E. **Efficiency of a Cupola Furnace.** H. Jungbluth. *Giesserei,* v. 43, Apr. 12, 1956, p. 180-184. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB70.)

Previously abstracted from original. See item 311-E, 1956. (E10, CI)

845-E. (German.) **Molding Box Design.** W. G. Rathmann. *Giesserei,* v. 45, Sept. 25, 1958, p. 623-624.

Difficulties encountered in bolting together cope and drag; proposals to overcome difficulties. (E19, 17-51)

846-E. (German.) **Manufacture and Properties of Foundry Products From Iron-Base Alloys.** J. Goffart. *Industrie-Anzeiger,* v. 80, Sept. 12, 1958, p. 26-28.

(E-general; Fe-b, 5-60)

847-E. **Co-Operation and Co-Ordination Between Pattern Shop and Foundry.** E. H. Beech and N. Bradshaw. *British Foundryman,* v. 51, Aug. 1958, p. 363-370.

Improved fabrication by new molding and casting techniques for various complicated parts. (E19, E17, E11; CI, 17-51)

848-E. **Aspects of Tropenas Converter Steel.** G. H. Ford. *British Foundryman,* v. 51, Aug. 1958, p. 396-398.

Construction details and operational procedure with reactions, advantages, disadvantages of method. (E10b, W18q; CN, AY)

849-E. **The Common Sense of Cupola Operation.** E. Dibden. *British Foundryman,* v. 51, Aug. 1958, p. 399-401.

Cupola size, melting rate, well depth, height of preheating zone; air requirements and preparation of sand bed, tap and slag hole; function of coke bed and effect of fluctuation of its height on metal chemistry; effect of blast volume on bed and melting rate. (E10a, W18d; ST, 17-52)

850-E. **Vacuum Melting Improves Investment Casting,** J. A. Miller. *Journal of Metals,* v. 10, Aug. 1958, p. 522-524.

5 ref. (E10, E15, 1-73)

851-E. Hot-Blast Cupola Finds Place in Steelworks. *Journal of Metals,* v. 10, Sept. 1958, p. 596-598.

Cupolas melt scrap for steelmaking furnaces in Germany. 5 ref. (E10a, D2a, D3g, 1-66)

852-E. Pinhole Porosity in High-Alloy Steel Castings. R. J. Mangone, A. M. Hall, W. T. Bryan and C. E. Sims. *Journal of Metals,* v. 10, Dec. 1958, p. 810-814.

Major variables affecting this phenomenon are H content of melt, pouring temperature and mold-moisture content. 5 ref. (E25n; SS-b, 5-60, 9-68)

853-E. Foundry Methods Switch Eliminates Hot Tears in Large Castings, Cuts Weld Time. Hubert Chappie. *Western Metalworking,* v. 16, Oct. 1958, p. 62-63.

In the production of 27,000-lb. steel press platens, five changes in practice were made. Use of a sand that absorbs expansion, multiple gating of correct thickness, external chills, favorable design. (E11, ST, 9-72)

SECTION F

PRIMARY MECHANICAL WORKING

1-F. Diamond Wire Drawing Dies. *Metal Industry,* v. 91, Oct. 25, 1957, p. 353-357.

Investigation into the performance of English and foreign dies. (To be continued.)
(F28, W24n, 1-52; NM-k 37)

2-F. (German.) **Computation of the Mean Deformation Resistance and of the Rolling Pressure Arising at Cold and Hot Rolling of Square Rods and Sheets.** A. Geleji. *Acta Technica,* v. 18, no. 1-2, 1957, p. 77-100.

Method for computing deformation resistance of hot and cold rolling; formulas and tables. (F23)

3-F. (Russian.) **Rolling of Rails With a Profile Groove in Blooming Mill Rolls.** N. I. Beda, G. P. Borisenko and M. P. Galemin. *Stal',* v. 17, May 1957, p. 431-435.

Using the fourth pass in blooming mill rolls for rail profiles where the split is staggered results in higher rate and a minimum of scrap due to fine cracks. 5 ref.
(F23, W28a, 1-52, T23q; ST)

4-F. (Russian.) **Experimental Determination of Stresses During Rolling.** V. N. Poturaev. *Stal',* v. 17, May 1957, p. 438-440.

Results obtained aid designers of equipment to calculate more accurately the requirements for new technological processes in which metal is deformed under pressure. (F2, F23, 17-51)

5-F. Industrial Diamonds in the Wire Mill. L. A. Zucker. *Industrial Diamond Review,* v. 17, Sept. 1957, p. 173-175, 179.

Practice at Union Wire Die Corp. (F28; 1-2, NM-k37)

6-F. Continuous Rolling: Fundamentals of Design and Calculation of Roll Speed. Z. Wusatowski. *Iron and Steel,* v. 30, Nov. 1957, p. 609-610, 617.
(F23, 1-61, 17-51)

7-F. Diamond Wire Drawing Dies (Concluded). *Metal Industry,* v. 91, Nov. 1, 1957, p. 379-381.

Mountings, die contours, die characteristics, X-ray examination.
(F28, W24n; NM-k37)

8-F. Heavy Flanged Forgings Fully Formed With Split Die. *Metalworking,* v. 8, Nov. 1957, p. 10-11.

Split-die method used for pipe fittings of high-pressure oil and gas wells gives fully formed forgings to precise dimensions with grain flow that gives the greatest strength. (F22, T6a; ST)

9-F. Welded Structure Improved by Forging. W. Wollering and E. Lundby. *SAE Journal,* v. 65, Oct. 1957, p. 122, 125.

(F23, C5; U, *Mo, Al, Si, Ti, V*)

27-F. **Lubrication in Wire Drawing.** J. G. Wistreich. *Wire Industry,* v. 24, Oct. 1957, p. 954-958.

Conditions in die, methods of lubrication, forced lubrication and performance of die. (To be continued.)
(F28; 18-73)

28-F. (German.) **Layout of High Capacity Rolling Mills for Steel Sections and Wire Rod.** Hans Peter Lemm. *Stahl und Eisen,* v. 77, Sept. 1957, p. 1181-1195.

Comparison of semicontinuous and continuous plants; handling and treating billets charged into continuous rolling mill trains. 5 ref. (F23q, W23d; 4-53, 4-57, 18-67; ST)

29-F. (Russian.) **Cooling Technology for Rolled Stock Sensitive to Flaking.** D. A. Litvinienko, V. V. Turitsyn and P. N. Sporyshkov. *Metallurg,* v. 2, July 1957, p. 23-24.

New, shorter cooling schedules for steels sensitive to flaking on rolling. (F23; ST, 9-70)

30-F. (German.) **Forging Technique.** Otto Kienzle and Kurt Lange. *VDI Zeitschrift,* v. 99, Aug. 1957, p. 1197-1199.

Literature review. 47 ref. (F22)

31-F.* (Portuguese.) **Characteristics of Cold Rolled Thin Sheet Steel Manufactured by Cia. Siderurgica Nacional.** Sylvio E. Friedrich. *ABM, Associacao Brasileira de Metais, Boletim,* v. 13, July 1957, p. 245-266.

Cold rolling practice at Volta Redonda Works, only Brazilian producer of cold rolled sheet; types of steel used and requirements for subsequent deep drawing; control methods and use of metallographic tests; desirable characteristics of sheet for enameling and other special applications; finishing operations. 5 ref. (F23, 1-67; ST, 4-53)

32-F. Roll Pass Design for Combination Structural and Wide Flange Beam Mill. Herman E. Muller. *Iron and Steel Engineer,* v. 34, Dec. 1957, p. 85-98.

Inland has successfully combined rolling of wide flange beams with the units that comprised their standard mill facilities; modernization of existing 28-in. structural mill has been completed and procedures developed for producing salable sections; methods of rolling and roll design were interwoven with the mill modernization program. (F23, W23k, 17-51; ST)

33-F. Greater Flexibility for Wire Drawing. Maurice A. Nye and Robert C. Suttle. *Iron and Steel Engineer,* v. 34, Dec. 1957, p. 98-109.

Individual generators and electronic regulators provide high speeds in excess of 4000 ft. per min. at Steel Co. of Canada's new Parkdale works. (F28, W24; ST)

34-F. Modern Rod and Merchant Mill. W. R. Potts and R. M. Lang. *Iron and Steel Engineer,* v. 34, Dec. 1957, p. 161-172.

Layout, design and equipment at Atlantic Steel Co., Atlanta, Ga. (F27, W23d, 18-67; ST)

35-F. Automatic Strip Control. *Metal Industry,* v. 91, Dec. 6, 1957, p. 475-476.

(F23, ST, 18-74; 4-53)

36-F. Wrought Titanium. J. R. Crane. *Metal Industry,* v. 91, Dec. 6, 1957, p. 483-484.

Wire production; extrusion; tube production; joining. (F24, F26, F28, K general; Ti)

37-F.* Heavy Press Forgings for Aircraft. E. C. Wright. *Metal Progress,* v. 72, Dec. 1957, p. 105-110.

Hydraulic presses of 35,000 and 50,000-ton capacity make Al forgings of record size. However, the higher pressures produce the smaller forgings to much closer dimensional tolerances, thus reducing weight of forgings one-half and final machining time to one-eighth. (F22, W22p, 1-2; Al)

38-F.* Larger Precision Titanium Forgings. J. J. Russ. *Metal Progress,* v. 72, Dec. 1957, p. 136. (Digest from "Present Limitations and Future Possibilities in Titanium Forgings", ASM Titanium Conference, Los Angeles, Mar. 25-29, 1957.)

In comparing Ti and 4130 steel for the production of semi-precision and precision forgings it is found that Ti parts are restricted to two-thirds the size of steel forgings; internal and external draft angles must be greater for Ti, minimum rib widths and corner radii should be slightly greater in Ti as should minimum fillet radii. (F22, 17-51; Ti)

39-F. (Czech.) **Examples of Rolling Mill Equipment Standardization.** Josef Vanicek. *Hutincké Listy,* v. 12, Oct. 1957, p. 887-880.

Standards for two and three-roll mills producing ingots and sections. (F23, W23, S22; ST)

40-F. (German.) **Methods Used in Measuring the Characteristic Data in Rolling Blooms. Pt. 1.** Hans Günter Müller and Hans-Jürgen Marx. *Stahl und Eisen,* v. 77, Oct. 31, 1957, p. 1577-1582.

6 ref. (F23, W23a, 4-52; ST)

41-F. (German.) **Forces Encountered in Rolling Blooms. Pt. 2.** Hans Günter Müller and Werner Lueg. *Stahl und Eisen,* v. 77, Oct. 31, 1957, p. 1583-1593.

5 ref. (F23, W23a, 4-52; ST)

42-F.* (Russian.) **Influence of the Shape of the Skelp Edges on the Seam**

Strength of Welded Tubes. E. M. Tsigankov. *Stal'*, v. 17, Aug. 1957, p. 728-730.

Investigation of tube welding with the skelp edges cut at different angles. The tubes with right angle skelp edges are the best. (F26p)

43-F. Extrusion Press Tooling. Pt. 1. Press Operation. Richard Baugh and John Lyons. *Light Metal Age,* v. 15, Dec. 1957, p. 19-20.

Explores problems to improve the techniques of producing high-quality 6063T5 Al extrusions when circle size approaches 85% of container size. (F24; Al)

44-F.* Influence of Extrusion Variables and Alloying Additions on the Grain-Size and Structural Stability of Extruded Lead. J. M. Butler. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 145-154.

Influence of extrusion temperature, speed and extrusion ratio on the grain-size of air-cooled and water-quenched commercially pure lead rods and pipes. Effect of small additions of Sb, Cu and Sn; resistance to grain growth at various temperatures of these extruded products measured. Stability of the extruded structure shows a dependence on alloying behavior and is related to the original grain size of the alloy. 6 ref. (F24, N3; Pb)

45-F.* How Iron Affects Forgeability of Copper Alloys. C. H. Hannon. *Iron Age,* v. 180, Nov. 7, 1957, p. 125-127.

Effects of iron additions, pouring temperature, cooling rate and silicon content on hot forgability and microstructure of ingots of copper alloy containing Al, Ni and Si. (F22, 17-52, 2-60, M27; Cu, *Al, Ni, Si*)

46-F. Forgeability Tests: Are the Results Reliable? P. M. Unterweiser. *Iron Age,* v. 180, Nov. 14, 1957, p. 153-156.

Forgability and forgability tests; flow stress, ductility, friction coefficient and other factors in the study of forgability. (F22, 17-52, 1-54)

47-F.* Planetary Hot Mill. D. McQueen Potter. *Iron and Steel,* v. 30, Oct. 1957, p. 475-482.

Details of new Sendzimir hot planetary mill; operations whereby single pass reductions of more than 90% are made in hot rolling strips of mild alloy or stainless steels giving tolerances comparable to cold rolling and good surface finish. (To be concluded.) 10 ref. (F23, 1-66, 1-52; AY, SS, 4-53)

48-F. Planetary Hot Mill. D. M. Potter. *Iron and Steel,* v. 30, Nov. 1957, p. 587-590.

Operation of Sendzimir hot planetary rolling mill. Comparison of mechanical properties of strip rolled from rimming steel slabs by planetary mill or by conventional mill as hot rolled and after subsequent cold rolling. (Conclusion.) (F23, 1-66; ST, 4-53)

49-F. Continuous Rolling. Z. Wusatowski. *Iron and Steel,* v. 30, Nov. 1957, p. 609-610.

(F23, 1-61; ST)

50-F. Lubrication in Wire-Drawing. Pt. 2. J. G. Wistreich. *Wire Industry,* v. 24, Nov. 1957, p. 1027-1029, 1046.

Factors affecting flow of soap powders. 16 ref. (F28, 18-73)

51-F. Mechanical Descaling and Drawing of Mild Steel Rod. L. Marsden. *Wire Industry,* v. 24, no. 287, p. 1039-1046.

(F27, L10, 4-61; CN)

52-F. (Russian.) **Forging in the Uralmashzavod.** I. S. Kvater. *Metallovedenie i Obrabotka Metallov,* no. 11, Nov. 1957, p. 72-76.

(F22)

53-F. (Russian.) **Utilization of Reserve Friction Forces on Blooming Mill Rolling.** B. P. Bakhtinov. *Stal',* v. 17, Sept. 1957, p. 805-809.

Use of reserve friction forces in blooming mill operation leads to a considerable increase of efficiency. (F23n, 4-52; ST)

54-F. (Russian.) **Influence of Cold Rolling Upon Properties of 8% Chromium Steels.** V. G. Dyakov. *Stal',* v. 17, Sept. 1957, p. 837-840.

7 ref. (F23, 1-67; SS, *Cr*)

55-F. Impact Extrusion Depth-to-Diameter Ratio is 32:1. John R. Saul. *American Machinist,* v. 101, Dec. 30, 1957, p. 69-71.

Aluminum rocket tube 8 ft. long extruded and chem-milled. (F24a, G24b, T2p, 17-57; Al)

56-F.* Planetary Mill Rolling. Some Practical Aspects. H. W. Ward. *Iron and Steel,* v. 31, Jan. 1958, p. 25-27.

In 1 sec. no less than 77 pairs of work rolls have each performed a small reduction and in 1 hr. well over a quarter of a million (277,200) light reductions have taken place to produce between 10 and 14 tons of strip. Roll life is remarkably good since each work roll is only in

contact with hot steel for about 7% of the time. During the remaining 93% of the time the work roll is revolving around the back-up roll in a deluge of cooling water so that the rolls are kept cool and retain their high surface finish. (F23, W23k, 1-52; ST, 4-53)

57-F.* The Planetary Mill and Its Uses. T. Sendzimir. *Iron and Steel Engineer,* v. 35, Jan. 1958, p. 95-101.

Planetary rolling is "cyclic" rolling or discontinuous rolling, where a roll first enters contact with the unworked portion of the material and then gradually works down, taking a rolling pass along the deformation zone and finally breaking contact with the material at the place where the material has reached its final thickness. (F23, 1-52; ST, 4-53)

58-F.* Flat Rolling. Effect of Plant Design and Layout on Capital and Operating Costs. W. F. Cartwright and M. F. Dowding. *Iron and Steel Institute, Journal,* v. 188, Jan. 1958, p. 23-35.

Four typical installations for producing flat rolled products. Qualities and grades of products defined; the use to which the end product is put defines the combination of these. No one plant can produce the full range of qualities; limitations of each. Operating costs of each plant tabulated. (F23, 17-53; ST)

59-F.* Precision Forging. H. L. Showalter. *Steel Processing and Conversion,* v. 43, Nov. 1957, p. 615-624, 646.

Vertical and horizontal machines, their forging mechanisms, adjustment and control systems; typical forging cycles, setup practice, temperature control and lubrication of German developed precision forging process; application of hot and cold forging processes. (F22, W22)

60-F. Finish Rolling of Cast Iron Ways for Machine Tools. W. Iwascheff. *Western Machinery and Steel World,* v. 48, Dec. 1957, p. 94-95.

(F23q, W25, 17-57; CI)

61-F. Switch to Forging Beefs Up Products. Howard E. Jackson. *Western Metalworking,* v. 15, Dec. 1957, p. 52-53.

Forgings replace castings to give strength, toughness to caterpillar rollers at Schmitt Steel Co. (F22n, W22q, 4-51; ST)

62-F. Lubricants for Wire-Drawing Dies. W. M. Halliday. *Wire Industry,* v. 24, Dec. 1957, p. 1145-1149, 1153.

Recommendations for die design and requirements for lubricants. (F28h; NM-h)

63-F. (German.) **Precision Steel Pipe —Seamless and Welded.** Eduard Schulte. *Industrie-Anzeiger,* v. 79, Oct. 11, 1957, p. 1245-1246.

(F26; ST, 4-60)

64-F. (Russian.) **Growth of Rolling Mill Production.** B. S. Shapiro. *Stal',* v. 17, Nov. 1957, p. 992-996.

(F23, A4; ST)

65-F. (Russian.) **Tube Industry in the U.S.S.R.** Yu. M. Matveev. *Stal',* v. 17, Nov. 1957, p. 997-1005.

(F26)

66-F. (Russian.) **Wire Production for Industrial Use.** N. I. Kadikov. *Stal',* v. 17, Nov. 1957, p. 1014-1016.

Development of the wiredrawing industry in the U.S.S.R. Its products are used for reinforcing rods in concrete, in the manufacture of bolts, springs and chains. Several research organizations specialize in solving its problems. (F28, 17-57, T7)

67-F. Foil Laboratory Developments. *Metal Industry,* v. 92, Jan. 10, 1958, p. 26.

Current developments at Star Aluminium Co., Ltd. (F23; Al, 4-56)

68-F. (French.) **Special Pipe for the Gas Field of Lacq, France.** A. Madrelle. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 327-330.

Steels with high elastic limit are embrittled by the H_2S rich gas of Lacq. Manufacture of pipe and control tests. 6 ref. (F26, Q26s; ST, 4-60)

69-F.* (German.) **Investigation of Rolling Oils and Oil Emulsions in Cold Rolling Test.** Werner Lueg, Paul Funke, Jr., and Winfrid Dahl. *Stahl und Eisen,* v. 77, Dec. 12, 1957, p. 1817-1830. (Henry Brutcher, Altadena, Calif., Translation no. 4100.)

Pure base oils and additions. Testing equipment, measuring methods, materials. Test results: strip thickness, rolling effort, torque and forward slip. Relation between lubricating effect and characteristics. 27 ref. (F23, 1-67, 18-73; ST, NM-h)

70-F.* (Italian.) **Modern Trends in Rolling of Alloy Steels.** N. Cremonese. *Metallurgia Italiana,* v. 49, Nov. 1957, p. 763-773.

Heating equipment, plant layout, types of stands and roll design as influenced by types of shapes required and variety in mechanical

properties of alloy steels.
(F23, W23; SS, TS)

71-F. (Polish.) **Influence of Rolling Reduction Ratio Upon Quality of Flat Blooms.** W. Leskiewicz. *Hutnik,* v. 24, Sept. 1957, p. 349-355.

Advantages of applying high rolling reduction ratios. Investigation of three different operations with progressively increasing rolling reduction ratios and their influence upon tensile and impact strength of the flat blooms. (F23n, W23a, 4-52)

72-F. (Russian.) **Heating of Alloy Steel Ingots in Recuperative Soaking Pits.** O. A. Semchenko, A. N. Baibuz, N. I. Medvedeva and A. T. Azarov. *Stal',* v. 17, Oct. 1957, p. 915-917.

Investigation of temperature drop along the cross-section of the ingots. Prevention of ingot defect formation due to uneven heat distribution. (F21b, W20g; AY, 5-59)

73-F. (Russian.) **Production of Hot Rolled Plates in High-Alloy X18H25C2 Steel.** V. A. Filonov, F. A. Ksenzuk, V. N. Lola and A. L. Khudas. *Stal',* v. 17, Oct. 1957, p. 917-918.

Composition of the steel, recommended conditions of hot rolling with emphasis on as high a temperature as possible. (F23q, 1-66, 5-53; SS)

74-F. (Russian.) **Technology of Heat Resistant Alloy Rolling.** I. P. Zabaluev, V. I. Travinin and M. A. Kovaleva. *Stal',* v. 17, Oct. 1957, p. 919-923.

Choice of roll calibration. Choice of billet temperature on rolling. Quality control of the alloy.
(F23, 2-62; SAG-h)

75-F. (Russian.) **Causes of Wrinkle Formation on Rolling of Round Rods on Heavy Caliber Mills.** S. Z. Yudovich and M. S. Kanev. *Stal',* v. 17, Oct. 1957, p. 924-928.

Proper design of rolls is recommended as a major single contributing factor to prevention of surface defects in rolling.
(F23q, W23k, 17-51; ST, 5-55, 9-71)

76-F.* **Influence of Extrusion Variables and Alloying Additions on the Grain-Size and Structural Stability of Extruded Lead.** J. M. Butler. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 145-154.

Influence of extrusion temperature, speed, and extrusion ratio on the grain-size of air-cooled and water-quenched commercially pure Pb rods and pipes. Effect of small additions of Sb, Cu and Sn, and resistance to grain growth at various temperatures of these extruded products. Extrusion temperature has a marked influence on grain size. Small additions of alloying elements diminish the grain size of water-quenched pipe, but their influence on the grain size of air-cooled material is determined by their alloying characteristics. The stability of the extruded structure also shows a dependence on alloying behavior and is related to the original grain size of the alloy. 6 ref.
(F24, M27c, 2-60; Pb)

77-F. Automated Line Adjusts Easily to Design Changes. R. H. Eshelman. *Iron Age,* v. 180, Dec. 5, 1958, p. 144-146.

Planning and standardized dimension of tubes allow automated line to be modified to meet design changes. (F26p, 18-74)

78-F. Press-Form Metal Tubing With Simple Dies. Federico Strasser. *Iron Age,* v. 180, Dec. 12, 1957, p. 127-129.

Basic types of dies and production of short length of tubing from flat pieces of sheet metals. Illustrates variety of closures and cross sections. (F26r, W24n)

79-F. Technique of Forging. O. Kienzle and K. Lange. *Metal Treatment and Drop Forging,* v. 25, Jan. 1958, p. 22-24.

Review of 1956 literature.
(F22, 10-54)

80-F. Cold Rolling of Extra-Hard Carbon Steel, and Its Influence on Heat Treatments Involving Quenching. M. Massin. *Sheet Metal Industries,* v. 34, Dec. 1957, p. 929-940.

8 ref. (F23q, 1-67, 2-64; CN)

81-F. Swagers Point, Form, Assemble. *Steel,* v. 141, Dec. 9, 1957, p. 157-160.

Advantages of swaging for internal threading, internal forming, assembling, pointing, tapering and straight reduction on a variety of metal parts. (F25)

82-F. Fusion Welding in Pipe Fabrication. W. S. Schaefer. *Welding Engineer,* v. 43, Feb. 1958, p. 34-36.

(F26p; 4-60, ST)

83-F. (German.) **Power Requirement in Drawing of Steel Rod.** L. Möckel. *Fertigungstechnik,* v. 7, Dec. 1957, p. 537-543.

Experimental technique in determination of traction power. The formula of Siebel can be used but theoretical values are lower than the actual ones. The traction power is independent of speed of drawing. (F27, 4-55; ST)

84-F. (German.) **Drawing and Upsetting of Cold Rolled Steel Bars.** Winfrid Dahl and Werner Lueg. *Stahl und Eisen,* v. 77, Dec. 12, 1957, p. 1795-1802.

Review of materials and methods; forces involved. Comparison of test results. Springiness; hardness determinations. 19 ref.
(F27, F22j; ST, 4-55)

85-F. (Swedish.) **Economic Considerations in Connection With Machining of Rolls.** Hans Warrol. *Jernkontorets Annaler,* v. 141, Nov. 1957, p. 798-803.

For rolling high-grade steel rod, turned rolls were found economically superior to ground rolls, especially for rolls with high surface hardness. (F23q, W23k, G17a; ST)

86-F. Induction Heating for Forging. P. E. Hammarlund and Y. Sundberg. *ASEA Journal,* v. 30, no. 10, 1957, p. 127-134.

New applications of induction heating in modernization of forge shops. (F21b, 1-52, 1-69, F22)

87-F. Aluminium Extrusion Plant at Pietermaritzburg. *Engineer,* v. 204, Dec. 20, 1957, p. 912-914.

(F24, 18-67; Al)

88-F. Manufacture of Tin Plates in India. Y. A. Gopal Rao. *Indian Institute of Metals, Transactions,* v. 10, 1956-57, p. 223-229.

6 ref. (F23, L16; ST, *Sn,* 4-53)

89-F. Heating at High Speed. Norman H. Davies and Richard J. Reed. *Metal Progress,* v. 73, Feb. 1958, p. 79-84.

High-speed heating of metal requires both convection and radiation from furnace gases and walls considerably hotter than finishing temperature. Consequently, fast controls are necessary to prevent overheating the work if the production line slows down. (F21b, W20h, P11k)

90-F.* Modernization in Heating for Hot Forming. Philip W. Morse. *Metal Progress,* v. 73, Feb. 1958, p. 85-90.

A 60-cycle 3-phase current can economically heat billets for forging, upsetting or extrusion. After the magnetic change point is passed, 960-cycle coils—dual purpose—carry the temperature higher. Higher frequencies are used for smaller billets. Several completely automatic systems are described.
(F21b, W28s; ST, Mg, 4-52)

91-F.* Influence of Forging Temperature on Mechanical Properties of Al-V Titanium Alloys. L. S. Croan and F. J. Rizzitano. *American Society for Metals, Transactions,* v. 51, Preprint no. 75, 1957, 26 p.

Effects of forging temperature on the mechanical properties after heat treatment of several heats of 6% Al, 4% V and 7% Al, 4% V titanium alloys. A high-temperature production forging technique involving press forging from above the beta transus temperature and water quenching from the press has been developed. Toughness, as measured by V-notch Charpy impact resistance at −40° F. may be increased by as much as 50% without any significant effect on strength. Although a gradual loss in ductility results from the use of increasingly high forging temperatures, the loss is insignificant at the working temperatures recommended.
(F22, 2-61, Q27a, Q23p; Ti, *Al, V*)

92-F.* 'Controlled Cooling' of Hot Ingots in a Single-Ingot Pit at Appleby-Frodingham. A. Jackson, N. H. Turner and R. C. Walthew. *Iron and Steel Institute, Journal,* v. 188, Feb. 1958, p. 114-118.

General application of the method depends on the deviation from expected casting and stripping times and from the intended sequence of rolling being reasonably controlled. Under these conditions the fuel consumption per ton of ingot may tend to go down towards 0.3 therms per ton as against the approximate 3 therms per ton consumed in the latest gas soakers installed, when dealing under similar conditions with ingots of equivalent track times. (F21b; ST, 5-54)

93-F. Roll-Separating Force and Minimum Thickness of Cold-Rolled Strips. K. Tong and G. Sachs. *Journal of Mechanics and Physics of Solids,* v. 6, no. 1, 1957, p. 35-46.

Theory for predicting roll-separating forces is based on concept that the process of plastic deformation in rolling may be approximated by that of the plane-strain compression between parallel plates. Method for determining coefficient of friction and flow stress of materials. 14 ref. (F23, Q24, Q9n; Cu, 4-53)

94-F.* Production and Conversion of Aluminium Foil. J. R. Green. *Metallurgia,* v. 57, Feb. 1958, p. 71-73.

Foil production, foil stock, rolling, separation, annealing, properties and applications. (F23; Al, 4-56)

95-F. (Hungarian.) **Calculation of Deformation Resistance in Hot and Cold Rolling.** Sandor Geleji. *Kohaszati Lapok,* v. 12, Apr-May 1957, p. 145-150.

Resistance could be determined by experiment only. 12 ref. (F23)

96-F. (Hungarian.) **Calibration of Rolls for Pipes With Constant Internal and Variable External Diameters.** Jenö Gati. *Kohaszati Lapok,* v. 12, Apr-May 1957, p. 170-175.

New rolling technology for pipes having varying profiles. 4 ref. (F26s, S23)

97-F.* **Canadian Picture on Pipe, Tubing and Casting.** D. A. Adamson. *Canadian Mining and Metallurgical Bulletin,* v. 51, Feb. 1958, p. 102-107.

Continuous butt welding, electric resistance welding, submerged arc welding, seamless tube forming processes in various Canadian plants. Mannesmenn process for making seamles tubing. Size and tonnage capacities of the plants. (F26, 10-55)

98-F.* **Designing for Cored Forgings.** Carl J. Pfeifer. *Materials in Design Engineering,* v. 47, Feb. 1958, p. 122-124.

A cored forging is produced by a combination of closed die forging and extrusion. The special press required is equipped with mechanisms to introduce core pins, mechanically, immediately before pressure is exerted on the hot metal. The metal is forced to flow by displacement, filling the cavity and at the same time extruding around the cores to form cavities. (F22k, 17-51)

99-F. **Lubricants for Wire-Drawing Dies. Pt. 2.** W. M. Halliday. *Wire Industry,* v. 25, Jan. 1958, p. 59-62.

(Conclusion.) (F28, W24n; NM-h)

100-F. (German.) **Use of Fuel Oil in Forging Plants.** Karl-Heinz Weber. *Stahl und Eisen,* v. 78, Jan. 23, 1958, p. 87-93.

(F21b, W20h, 1-55; RM-k30)

101-F. (Hungarian.) **Determination of the Velocity of Deformation in Extrusion and Drawing.** Jozsef Kocsis. *Kohaszati Lapok,* v. 12, Jan-Feb. 1957, p. 71-75.

(F24, F27, F28, G4, 3-67)

102-F. (Hungarian.) **Extrusion Failures in Nonferrous Semifinished Products.** Zoltan Hegedüs. *Kohaszati Lapok,* v. 12, Jan-Feb. 1957, p. 75-79.

12 ref. (F24, 9; EG-a38)

103-F.* (Italian.) **Defects in Light Alloy Forgings and Stampings.** Eugenio Hugony. *Rivista di Meccanica,* v. 8, Nov. 23, 1957, p. 37-39.

Defects in parts submitted to Light Metals Experimental Institute, Milan, were analyzed as follows: Part made of Al-Cu-Mg alloy had cracks and blisters caused respectively by improper heating conditions during forging, and overheating during heat treatment; part in Al-Si-Mg alloy had developed blisters due to inclusions during melting and casting of original metal; group of difficult-to-machine parts in Al-Si-Mg alloy had not been properly tempered, contained foundry inclusions. (F22, C5, 9-72, 9-69; Al)

104-F.* (Swedish.) **Determination of Die Wear in Wiredrawing With Radioactive Isotopes.** Erik Lindstrand. *Jernkontorets Annaler,* v. 141, Dec. 1957, p. 837-846.

Mild steel wire was drawn through three irradiated tungsten carbide dies. Arc-shaped shavings from a third of the wire periphery were packed in scintillation detector. Count rates from tests performed with different coatings and lubricants showed amount of wear debris ranged from 0.5×10^{-8} to 5×10^{-8} g. per m. of drawn wire. (F28, Q9, X2c, W24n, 1-59)

105-F.* (German.) **Finish Rolling of Cylindrical Trunnions With Diameter of 1.5-5 Mm. by Plunge Method.** G. Pahlitzsch and H. J. von Eitzen. *Werkstattstechnik und Maschinenbau,* v. 47, Nov. 1957, p. 589-597.

Mechanism of finish rolling; technique of rolling small articles. Stress in worked article; construction of finishing rolls; influence of working conditions; influence of properties of materials. Adherence to standard tolerances. (F23q, W23k, 1-52)

106-F.* **Rolls and Rolling. Sheet Piling.** E. E. Brayshaw. *Blast Furnace and Steel Plant,* v. 46, Mar. 1958, p. 310-312, 337, 339, 341, 345-348.

Rolling techniques and roll design requirements for production of sheet piling. (F23; ST, 4-55)

107-F. **Primary Roll Neck Bearings and Their Protection.** George Sackerson. *Iron and Steel Engineer,* v. 35, Feb. 1958, p. 103-110.

In order to get maximum bearing life, polished roll necks, plentiful, clean, cool water for cooling, a dependable source of grease, and scale guards are necessary. Accurate

maintenance records are required to insure replacement when required. (F23, W23m; ST, NM-h)

108-F.* Seamless Tube Making by the Calmes Process. Albert Calmes and Clyde A. Roberts. *Iron and Steel Engineer,* v. 35, Feb. 1958, p. 124-132.

Ingots are taken directly from the openhearth and made into seamless tubing in one continuous process. Principal steps are: ingot heating, press piercing, elongating, rotary forging, reheating, sizing, polishing, finishing and testing. (F26; ST)

109-F. J & L Starts Operation of 44-In. Mill at Aliquippa. *Iron and Steel Engineer,* v. 35, Feb. 1958, p. 164-165, 169-170.

A semicontinuous hot strip rolling mill produces coils up to 40 in. wide and weighing 20,000 lb. Operation is nearly automatic, the rolling being controlled by programs fed through IBM equipment to digital analog equipment.
(F23, W23c, 18-74; ST)

110-F. Cored 90-Mm. Gun Tubes Extruded in 5 Min. Henry J. Decelle, Adam A. Krystofik and John Penrose. *Metalworking Production,* v. 102, Jan. 31, 1958, p. 190-193.

Pilot scale operations indicate that extrusion method produces tubes superior to forging with significant savings in time and material.
(F24, T2m; 4-60)

111-F.* Improvement of Castings by Press Forging. A. H. Murphy, L. L. Clark and W. Rostoker. *Modern Castings,* v. 33, Mar. 1958, p. 95-102.

Significant increases in the proof, yield and ultimate strengths of two cast high-strength Al alloys and one cast Mg alloy can be obtained by forging which produces 15-30% deformation. (F22; Al, Mg, 5)

112-F.* Press Forging Strengthens Light Metal Castings. W. Rostoker. *Modern Metals,* v. 14, Feb. 1958, p. 42-45.

Forging of light metal castings at just under peak aging or recrystallization temperature increases yield strength up to 84% in Al and 58% in Mg. (F22; Al, Mg, 5-61)

113-F. Induction Heating for Hot Forming. The "New Look" in Induction Methods for Forging and Extrusion Heating. Phillip W. Morse. *Steel Processing and Conversion,* v. 11, Feb. 1958, p. 95-101.

(F21b, 1-69, F22, F24)

114-F.* Press Forging of Ingot Uranium. John A. Fellows and H. J. Schaffer. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 67-71.

Practice employed in preparing ingots produced by thermit reaction between uranium tetrafluoride and magnesium for secondary rolling or extrusion. (F22, C26; U, 5-59)

115-F.* Rolling of Uranium. Gale S. Hanks, James M. Taub and Denton T. Doll. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 73-86.

Rolling schedules for reducing uranium plates and ingots to sheet of deep drawing quality. Hot rolling at 625° C. reduces ingot to intermediate thickness followed by warm rolling at 300° C. with and without intermediate anneal and with varying amounts of cross rolling to reduce sheet to final thickness. Relation of percent reduction and temperature of hot rolling to grain structure, ultimate strength, yield strength, elongation and hardness. Results of cup and mechanical tests indicate the variation of warm rolled sheet characteristics with rolling direction, percentage of reduction and method of annealing. 4 ref. (F23, Q-general; U, 4-53)

116-F.* Extrusion of Uranium. P. Loewenstein. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 87-94.

Phase transformation, oxidation, galling and other problems encountered in extrusion of uranium. Technique, die design, canning material, lubricants, extrusion constants, temperatures, speed, surface finish, microstructure and shapes of uranium-rich alloys extruded in the alpha phase or in the gamma phase. 7 ref. (F24; U)

117-F.* Cold Working of Uranium. James M. Taub, Denton T. Doll and Gale S. Hanks. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 95-106.

Uranium can be rolled, deep drawn, swaged and drawn into fine wire without difficulty at temperatures above the transition which exists between 100 and 150° C. Effect of percentage reduction and strain on grain size of cold rolled sheets following annealing. Effect of annealing atmosphere on mechanical properties: influence of impurities on cold working characteristics.
(F23, F25, G4, F28, 1-67; U)

118-F. (French.) **Latest Methods of Aluminum Extrusion.** Charles H. Wick. *Machine Moderne,* v. 52, Jan. 1958, p. 65-68.

(To be continued.) (F24, W24g)

157-F. Quantity Production of Nails. *Machinery (London),* v. 92, Mar. 1958, p. 667-671.

Principal features of Ransohoff nail cleaning plant installed at Castle Works, Cardiff, England; processes involved in nail manufacture, before and after cleaning cycle. (F27, T7f; ST)

158-F. Welded Tubing at High Speeds. *Modern Industrial Press,* v. 20, Apr. 1958, p. 23-24.

Buick steps up production of exhaust pipes with new tube mill and improved bending and forming methods.
(F26p, W23h, T21b; 4-60, ST)

159-F.* The Working of Molybdenum and Its Alloys. W. L. Bruckart. Paper from "The Metal Molybdenum", American Society for Metals, p. 109-142.

Primary working of arc-cast molybdenum—preparation of ingots, extrusion procedures, rolling; limits for section size of Mo bar, plate, strip and sheet; forging; current practices in the primary working of powder metallurgy Mo; fabrication processes including sawing, shearing, slitting, punching, binding, deep drawing and machining, heat treatment and stress relieving.
(F-general, G-general; Mo)

160-F.* Fabrication at Very High Temperature Under a Controlled Atmosphere. J. D. Nisbet. Paper from "The Metal Molybdenum", American Society for Metals, p. 143-150.

Feasibility of hot working of Mo has been demonstrated by encasing a forging hammer in an appropriate enclosure filled with argon, with induction-heating facilities built in. Samples of Mo-Cb alloy declared unforgeable at steel working temperatures were readily forged. 4 ref.
(F22; Mo)

161-F.* Forging of Molybdenum Alloy Turbine Blades. J. J. Russ and G. E. Schrader. Paper from "The Metal Molybdenum", American Society for Metals, p. 511-518.

Results indicated that precision turbine blades can be successfully forged from the 0.5% Ti-Mo alloy. To insure adequate strength properties for turbojet engine operation, at least 70 to 80% deformation must be performed below the recrystallization temperature. With properly processed forging stock and adequate controls of heating times and forging temperatures, blades with sufficient strength and resistance to recrystallization in service can be produced. 6 ref.

173-F. Pellet Extrusions Beef Up Magnesium Structures. G. S. Foerster and H. A. Johnson. *Product Engineering, Design Edition,* v. 29, May 12, 1958, p. 80-81.

Molten Mg is sprayed through an orifice onto a spinning disk in an atmosphere of natural gas. Centrifugal force disperses the metal into small droplets. These solidify and are blown to a screening station where oversize pellets are removed. To extrude the pelletized material, they are blown through pipes into the chamber of an ordinary extrusion press from which they are extruded through a die that gives the desired shape.

182-F.* (Russian.) **Determination of Spreading in Rolling.** M. V. Shuralev and S. G. Nekrasov. *Stal'*, Jan. 1958, p. 57-60.

A relatively simple formula permits the determination of spreading which takes place while rolling stock. Certain experimental correction factors are applied for various conditions. 6 ref. (F23)

183-F.* (Russian.) **Production of Hot Rolled Tubes From Steel No. EI595 and Their Properties.** N. S. Alferova, G. P. Pishchikov and V. P. Konovalov. *Stal'*, Jan. 1958, p. 60-66.

This steel shows pronounced tendency to brittleness under cold working. Investigation of the effect of heat treatment on the tendency toward brittleness and rupture showed that heating to 950° C., followed by quick quenching, lowers the critical temperature of transition. Rolling at lower temperature results in fine grain structure and reduced sensitivity to brittleness. 4 ref. (F26s, Q26s; ST)

184-F.* (Russian.) **Weldability of Cracks in Alloy Steels by Rolling.** I. N. Golikov and B. M. Litvinov. *Stal'*, Jan. 1958, p. 66-70.

Longitudinal cracks are easily welded by small amount of deformation of 2-3 extension coefficient. Transverse cracks lengthen as rolling proceeds, their walls touch and finally become welded together. Cracks up to 25 mm. in a square bar of 125-140 mm. become welded while the bar is reduced to 40 x 40 mm. 6 ref. (F23, 9-72; AY)

203-F. (Italian.) **Machining of Metals by Means of Hot Plastic Deformation. Pt. 10. Drop Forges.** Romeo Giusfredi. *Rivista di Meccanica*, v. 9, Mar. 15, 1958, p. 9-14.
(To be continued.) (F22n)

204-F. (Russian.) **Reduction of Waste Ends of Billets in Tubemaking.** S. I. Orlov. *Stal'*, v. 18, Apr. 1958, p. 335-339.

By proper alignment of tube billets end irregularities were considerably reduced. Use of new lengthened-type mandrel improves performance of piercing mill and reduces number of tubes rejected due to inner flaws. (F26)

205-F.* **The Calculation of Drawing Force and Die Pressure in Wire Drawing.** P. W. Whitton. *Institute of Metals, Journal*, v. 86, May 1958, p. 417-421.

An expression has been obtained in terms of the drawing variables which permits the prediction of drawing load and die pressure. Accuracy is within ± 10% over the wiredrawing range, which halves the errors given by previous methods. Theories which assume homogeneous - deformation conditions, while extremely accurate at the very low angles, are not suitable generally. 14 ref. (F28)

207-F. Aluminum Sheathing of Flat Uranium Plates by Extrusion Cladding. A. J. Mooradian. Paper

from "Fuel Elements Conference", U. S. Office of Technical Services, T1D-7546, p. 120-141.

Process consists in using the U flat as a moving mandrel over which the sheath is extruded directly, thereby completely encasing the U with Al as it passes through the die. Both Ni plated and bare U flat elements sheathed in Al by the extrusion cladding method have been successfully tested under irradiation. (F21g, T11g; U, *Al*, 2-67)

208-F. Coextrusion Applied to the Fabrication of Solid or Disperse Fuel Elements. R. Montagne and L. Meny. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, T1D-7546, p. 142-156.

Since the usual cladding methods were unsuccessful the bond was obtained by a process called "co-extrusion". It consists of simultaneously extruding the fuel and its cladding. (F24, T11g; U, *Zr*, 8-59)

209-F. Zirconium Cladding of Uranium and Uranium Alloys by Coextrusion. A. R. Kaufmann, J. L. Klein, P. Loewenstein and H. F. Sawyer. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, T1D-7546, p. 157-181.

Fabrication of Zr-clad uranium fuel elements having integral Zr end seals. (F21g, T11g; U, *Zr*)

210-F. Preparation and Sheathing of Plutonium-Aluminum Fuel Alloys for the NRX Reactor. O. J. C. Runnalls and K. L. Wauchope. Paper from "Fuel Elements Conference", U. S. Office of Technical Services, T1D-7546, p. 778-788.

259-F.* (French.) **Investigation of the Forging of Alloy T-C_3Fe.** A. Saulnier and R. Develay. *Revue de Metallurgie,* v. 55, May 1958, p. 433-441.

The mechanical properties of forged products in T-C_3Fe (titanium with 2.7% Cr and 1.3% Fe) determined as a function of the temperature at the start of the first hot working, reduction of thickness during the hot working, and method of taking the specimens. Structures were observed with optical and electron microscopes. A clear difference in properties is established according to whether the forging temperature is within the $\alpha + \beta$ field (below 800° C.) or in the β field (above 800° C.).
(F22, Q-general; Ti, *Cr, Fe*)

260-F.* (French.) **Investigation of the Forging of Alloy T-A_6V.** R. Syre and A. Saulnier. *Revue de Metallurgie,* v. 55, May 1958, p. 442-447.

To achieve tensile strength of at least 92 kg. per sq.mm. in forged products in the titanium alloy T-A_6V (6% Al, 4% V) with elongations of at least 10%, it is necessary to transform the lamellar cast structure into an equiaxed structure. With forging beginning at 950° C. this cannot be achieved unless reductions of thickness of 80% are applied during final working. Reduction can be lowered to 50% either by decreasing the temperature at which forging is begun to 900° C. or by using a swaging pass before the final hot working.

Elimination of concept of coefficient of friction from equations for calculating the forces required for a given type of deformation in the working of metals by pressure. Quantitative evaluation of effect of various lubricants in the working of metals by pressure, specifically the drawing of metal wire.
(F28; NM-h)

267-F.* (German.) **Cold Rolling of Steel of High Carbon Content With Sorbitic and Pearlitic Structure.** Wilfried Roth, Hermann Lassek and Fritz Fischer. *Stahl und Eisen,* v 78, July 10, 1958, p. 948-955.

Cold rolling of high-carbon steels, without intermittent annealing, revealed the superior malleability and tensile strength of sorbitic over pearlitic structure. No significant difference could be detected in tempering quality between cold rolled and soft rolled steels. Heat treating tests on Grade C 115 W 2 steel for mechanical and structural behavior indicated that deformed structure of cold rolled strip could be transformed into granular cementite at low temperatures and in a short time. Sorbitic steels offer a substantial cost reduction potential over pearliitic steels and may lead to refinements in strip mill processes. 14 ref. (F23, 1-67, Q-general, 2-60, 2-64, 2-71; ST, 4-53)

268-F.* (German.) **Effect of Different Working Conditions of a Three-Stand Cold Rolling Tandem Mill Train on Mechanical Properties of Steel Strip.** Jacques Gerhard Brockhaus, Fritz Fischer, Harald Graetz and Klaus Ohlwein. *Stahl und Eisen,* v. 78, July 10, 1958, p. 955-960.

Cold rolling of low-carbon strip steel, 0.98 × 1.50-mm., reduced 70 to 60% by a 178-mm. three-stand tandem mill train, reveals that total tandem mill capacity increases when reduction is greater at second and third mill stands. Tensile strength improves with highest reduction at third stand. Influence of rolling on proof stress, tensile strength and hardness can be remedied by annealing and rerolling. Greater rolling capacity and tensile strength result when blasting is used for descaling instead of pickling. Rerolling eliminates effect of different descaling methods on mechanical properties. Tallow emulsion is easier to apply than wax emulsion but impairs rolling capacity, rolling strength and tensile strength of strip steel. 4 ref. (F23, W23f, Q-general, 2-64; CN, 4-53)

269-F.* (German.) **Experiments on the Application of the Upsetting Process With Cone-Faced Pressure Dies in the Hot Upsetting of Metals.** Gerhard Gartner. *Freiberger Forschungshefte,* no. B27, 1958, p. 28-51.

The right inclination of the cone faces is essential for preserving the cylindric mantle surface of the test piece, due to the friction caused by the cone angle. In the hot upsetting process good results could be obtained only when temperature loss over the heat conducting pressure dies can be avoided. The experiments were preformed with pure Al, duralumin and electrolytic Cu. 11 ref. (F22j, 1-66; Al, Cu-a)

270-F.* (German.) **A New Theory of Rolling.** Alexander Geleji. *Freiberger Forschungshefte,* no. B27, 1958, p. 52-83.

A study on the different forces present when a material passes through the gap between rolls. Some older theories do not include all forces involved. Mathematical formula for resistance against deformation at any point showing the interplay of stresses during the rolling process, spread and forward slip. 19 ref. (F23; 10-51)

271-F.* (German.) **The Neutral Point Angle and the Forward Slip in a Rolling Process With Spread.** Zygmunt Wusatowski and Zbigniew Szalajda. *Freiberger Forschungshefte,* no. B27, 1958, p. 84-110.

Mathematical studies show that the forward slip grows with increased rolling pressure and decreased upsetting effect, while it is reduced by an increased temperature. With an unchanged upsetting effect, the forward slip decreases in the same porportion as the spread increases. The proportion neutral-point-angle/contact-angle decreases with an increasing spread and, as a rule, with an increased temperature. 9 ref. (F23)

272-F. **How to Get More for Your Forging Dollar.** *Iron Age,* v. 182, Aug. 21, 1958, p. 89-104.

Guide to purchase and most effective use of carbon and low-alloy steel forgings.

Three general methods in common use are direct, indirect and impact extrusion. Corrosion resistance, machinability and mechanical properties of extrusions. (F24, G5, G17k, Q-general, R-general; 4-58)

297-F.* **Designing for Extrusions.** *Precision Metal Molding*, v. 16, Oct. 1958, p. 44-47.

Chemistry, physical properties and mechanical properties of nine extrudable Al alloys. (F24, P-general, Q-general; Al, 4-58)

298-F.* **Improvement of Welded Structures by Subsequent Forging Operations.** W. R. Wollering and E. H. Lundby. *SAE Transactions*, v. 66, 1958, p. 261-266.

Method results in development of physical properties in welded sections of alloy materials approaching those of the wrought parent material. Advantages include weight reduction in dynamically stressed wrought steel assemblies, increase in design factor values, conservation of critical alloy materials. (F22; 7-51)

299-F.* (Rumanian.) **Determination of the Free Spreading of Nonferrous Metals When Rolling by Noncalibrated Cylinders.** R. Miculescu, S. Bercu and I. Dragan. *Studii si Cercetari de Metalurgie*, v. 1, Jan-June 1956, p. 107-117.

In order to set up formulas and nomograms enabling the rolling operator to calculate the magnitude of spreading of metals during the rolling, a whole series of experiments were made, which herein are given in the form of tables. As a result of the comparative study between nonferrous metals and steel, it has been found that the same factors determine decisively the magnitude of the spreading during the rolling. The authors also have established a formula by which one can determine analytically the magnitude of the spreading in the case of rolling of these metals. For aluminum, it has not been possible to find a general formula, but it has been established that this metal presents a more pronounced spreading in function of the absolute magnitude of the reduction of height in comparison with the spreading of the copper or of the brass. 3 ref. (F23; Al, Cu)

300-F.* (Rumanian.) **Investigation of the Conditions of Adhesion in Rolling.** R. Fischgold. *Studii si Cercetari de Metalurgie,* v. 1, Jan-June 1956, p. 119-147.

Attempt to give a quantitative and qualitative appreciation of the reserves of friction forces existing during the transition from the initial moment of contact to the stabilized process by assuming for basic index the ratio $K = \frac{\alpha_{II}}{\alpha_I}$ (α_I being the angle of initial contact and α_{II} the contact angle in the stabilized phase of the rolling process). This coefficient is a function of the following factors: rolling temperature, nature and composition of the metal rolled, complexity of the rolling scheme, conditions of friction on the contact surface between the deformed metal and the cylinders. The coefficient K decreases as the rolling temperature rises, according to an almost linear relation. There is a pronounced decrease of the friction angle ψ_{II} in comparison with ψ_I in the case of hot rolling; for the cold rolling the value of ψ_{II} is considerable closer to that of ψ_I. 9 ref.

301-F.* **High Production Flat Rolling.** C. S. Ball and C. W. Starling. *Sheet Metal Industries,* v. 35, Oct. 1958, p. 767-774.

Integrated steelworks and continuous hot strip mill is an extremely complicated organism. Such a process may eventually break down because of its own complexity. Basic trends in the development of steel production and hot rolling are the direct manufacture of steel from ore; the direct manufacture of hot rolled sheet from pig iron and the development of the conventional sequence of blast furnaces, melting and refining furnaces—casting to solid form—hot rolling. 5 ref. Heat treatment, rolling, forging machining and finishing operations. (F-general, G-general, J-general; ST, SGB-a)

327-F.* How to Forge Molybdenum. *Steel,* v. 143, Nov. 3, 1958, p. 84-86.

Remedies for the following problems: high-impact velocity needed to begin plastic flow; oxidation; loss of control of furnace temperature. (F22; Mo)

328-F.* (Russian.) **Main Reasons for Variations in Thickness of Hot Rolled Strip Produced in Continuous Rolling Mill.** P. I. Grudev. *Stal',* v. 18, Sept. 1958, p. 813-817.

The elimination of gage variations may be achieved by providing for automatic displacement of mill screwdowns, depending on length, and consequently on temperature, of rolled strip. To prevent the influence of incidental factors on strip thickness it is advisable to use metal pressure on rolls as signal, initiating displacement of the mill screwdowns. (F23, 1-66, 1-61; ST)

329-F.* (Russian.) **Mastering the Technique of Rolling Heavy Plate According to Theoretical Weight.** I. D. Kuzemka. *Stal',* v. 18, Sept. 1958, p. 817-820.

Allowances calculated in conformity with a special method; rational roll design with reduction of roll wear (plus deflection); regular control of plate thickness and roll profile during rolling, with corresponding adjustment of thickness allowances where needed. (F23, W23b, 17-51)

330-F.* (Russian). **Influence of Metal Structure and Mechanical Properties of 08 KP Steel on Its Forgeability.** B. S. Natapov and D. E. Tsivirko. *Stal',* v. 18, Sept. 1958, p. 828-834.

Investigation to establish relationship between the physico-mechanical properties of sheet steel as determined in laboratory tests and its performance during forging. Main reasons for rejected forgings during deep drawing are the gross metallurgical flaws, reduced ductility and increased metal stiffness, as well as failure to observe correct methods during drop forging. To improve properties of sheet steel it is necessary to decrease its yield point and increase uniformity of sheet. 12 ref. (F22n, 17-52, G4b; ST, 4-53)

331-F.* (Russian.) **Durability of Diamond Drawholes for Micron Size Wire.** G. P. Gvosdyk and N. F. Andrianov. *Stal',* v. 18, Sept. 1958, p. 839-842.

Durability is greatest where the metal is purest (free of inclusions) and where the annealing temperature of ingots is high (to 1050°). The thinner the diameter of the wire and the greater the drawing speed, the greater the durability of drawholes. Durability is considerably lower during first draws, and

with increase in number of draws and in speed, the durability increases. It is greater when the pressure is lower (but that necessitates a greater number of drawholes). (F28, W24k; NM-k37)

1-G. Surface Grinding Aluminum Products. John E. Hyler. *Light Metal Age,* v. 15, Oct. 1957, p. 38. (G18k; Al)

2-G. Grinding Titanium. S. B. Watts. *Light Metals,* v. 20, Oct. 1957, p. 336-337. (CMA)

Titanium is easily ground at Lockheed by using speeds of less than 1800 sfpm., a nitrite-amine rust inhibitor as a cutting fluid, and (for cylindrical grinding of the center type) 400-500 in. table feed, 0.001 in. downfeed and 0.05 in. crossfeed. (G18; Ti)

3-G. Development in Methods of Forming Titanium. *Machinery (London),* v. 91, Oct. 11, 1957, p. 853-857. (CMA)

The Aircraft Engine Division of Ford has developed forming methods for inlet guide vanes and compressor blades from titanium sheet. Procedures for folding sheet in a heated tool, resistance welding the trailing edges and expanding in a closed die to give the finished vane, and for roll-forging the compressor blades from an induction heated blank. (G1; Ti)

4-G. Dimensional Etching. Its Application to Airframes. Richard H. Andrew and Jacques L. Duvall. *Plating,* v. 44, Nov. 1957, p. 1186-1190.

Chemical milling process. 5 ref. (G24b, T24)

5-G. HRP Titanium Fabrication Experience From Loop T-1 Construction. P. A. Haas. *U. S. Atomic Energy Commission,* CF-56-3-167, Mar. 15, 1956, 11 p. (CMA)

Titanium is easily arc welded to give sound joints with high tensile strength. Oxygen, hydrogen or nitrogen pickup from air or water vapor causes cold embrittlement, and the metal must be protected by an inert gas atmosphere until it cools below 1100° F. The machinability of titanium is comparable to that of stainless steel. (G17, K1; Ti)

6-G. Transfer Lines Build Buick's New Dynaflow. *American Machinist,* v. 101, Nov. 4, 1957, p. 135-140.

Permanent mold Al castings for the case and rear bearing retainer are machined. (G17, 18-74; Al, 5-63)

7-G. Effect of Tool-Chip Contact Area in Metal Machining. H. Takeyama and E. Usui. *Journal of Applied Mechanics,* Paper no. 57-A-45, 1957, p. 1-5.

Results of experimental, two-dimensional machining of brass tubes with tools specially designed to keep tool-chip contact areas constant. Analysis of coefficient of friction, stress distributions on rake face, significance of tool-chip contact area as related to machining performance. 10 ref. (G17; Cu-n)

8-G. Metal Spinning. New Imported Equipment Spins Economy Into Aircraft and Missile Parts. *Missiles and Rockets,* v. 2, Oct. 1957, p. 110-117. (G13, 1-52)

9-G. Cold Forming in Missile Production. *Missiles and Rockets,* v. 2, Oct. 1957, p. 118-119.

Cold extrusion at Norris-Themader Corp. (G5)

10-G. (German.) **Machining of Aluminum With Diamonds and Cutting of Close-Tolerance Threads.** K. Sterl. *Aluminium,* v. 33, Sept. 1957, p. 613-615.

Various forms of turning, recessing and drilling with diamonds; choice of tools and their treatment. Internal threads are best cut with single-pass plug taps with ground threads, narrow tooth webs and wide grooves; a new "elastic" tool

for external threading.
(G17; Al, SGA-j, NM-K37)

11-G. (German.) **Forming of Threads.** *Draht,* v. 8, Aug. 1957, p. 293-296.

The technology of warm and cold threading, particularly of material of high tensile strength; dies and rollers are used for forming threads, the tools being mounted on various types of semi-automatic and fully automatic threading machines.
(G17f)

12-G. (German.) **Theory of Stock Removal.** M. Kronenberg. *Werkstatt und Betrieb,* v. 90, Oct. 1957, p. 729-733.

The chip is considered as a moving system. A formula establishes a relationship between the chip compression factor, the coefficient of friction and the true rake angle of the tool. 8 ref. (G17)

13-G. (Japanese.) **Cutting by Powder Method.** Minoru Iwasa. *Casting Institute of Japan, Journal,* v. 29, Aug. 1957, p. 621-626.

Cutting of stainless steel and copper alloys by heat of oxidation of iron powder. Concrete and firebrick were also cut by iron and aluminum powder. (G22; Cu, SS)

14-G. (Russian.) **Deep Drawing of Certain Sheet Metals and Alloys at Various Speeds With Application of Heat.** N. A. Klyucharev. *Vestnik Mashinostroeniya,* v. 37, Aug. 1957, p. 40-45.

Drawing of steel, brass, aluminum and duraluminum; design of the press; drawing coefficients at speeds of 0.2 and 43 cm. per sec.; wall thicknesses at different height levels of the drawn specimen.
(G4b, 1-66; ST, Cu-n, Al)

15-G. (Russian.) **Influence of Soft Sheet Steel Properties Upon Durability of Punching Stamps.** P. G. Kovtun. *Vestnik Mashinostroeniya,* v. 37, Aug. 1957, p. 46-47.

Investigation of working life of deep drawing stamps in respect to size of ferrite grain and carbon contents of the sheet steel.
(G4b, 1-52; CN)

16-G. Special Techniques for Increasing Strength and Fatigue Life of Steel Stressed in Torsion. N. E. Hendrickson. *ASTM Bulletin,* v. 224, Sept. 1957, p. 40-42.

Shot peening and presetting make it possible for 40 lb. of steel in torsion bar springs to do a job that would otherwise require almost twice as much material. 4 ref.
(G23n, T7c; ST)

17-G. How to Remedy Defects in Drawn Shells. Federico Strasser. *Iron Age,* v. 180, Nov. 21, 1957, p. 125-127.
(G4c, 9)

18-G. Resistance Heating Titanium Alloys for Press Brake Forming. *Machinery (London),* v. 91, Oct. 18, 1957, p. 917. (CMA)
(G4d, W28; Ti)

19-G. Forming Titanium With Particular Reference to the Production of Aircraft Components. J. S. Kirkpatrick. *Sheet Metal Industries,* v. 34, Nov. 1957, p. 825-830. (CMA)

Forming on stretch press, press brake, deep drawing and skinning.
(G4d, G9, G13; Ti)

20-G. Choose the Right Lubricant. Pt. 2. *Steel,* v. 141, Oct. 21, 1957, p. 100-101.

Types of lubricant for drawing and forming operations. (G4; NM-h)

21-G. Tips on Turning Heat Treated Steels. *Steel,* v. 141, Nov. 25, 1957, p. 94-95.
(G17a, 2-64; ST)

22-G. Short Run Dies Offer Long Life. *Steel,* v. 141, Dec. 2, 1957, p. 94-96.

New ideas and methods of pressing lengthen life of dies. (G3, W24n)

23-G. Chem-Milling Handles Tough Job. *Steel,* v. 141, Dec. 2, 1957, p. 114.

Advantages of this complex method used in production of aircraft part. (G24b, T24a; Al)

24-G. From Sandstones to Diamonds —the Grinding Wheel Story. F. W. Foerste. *Welding Engineer,* v. 42, Dec. 1957, p. 34-37.
(G18, 6-69)

25-G. Understanding Grinders and Grinding Wheels. *Welding Engineer,* v. 42, Dec. 1957, p. 41-43.

Uses for grinding wheels; factors in selection of wheels; work speed; types of machines available. (G18)

26-G. Application and Working of Honeycomb Core. Pt. 2. W. A. Nordhoff. *Western Machinery and Steel World,* v. 48, Nov. 1957, p. 90-93.
(G general, T24a; 7-59)

27-G. Spinning Titanium Pressure Vessels. Fred Spiegl. *Western Metals,* v. 15, Nov. 1957, p. 48-49.
(G13, T26q; Ti)

28-G. Radial Draw Forming Contributes Design Economies for Jet Transport Production. *Western Metals,* v. 15, Nov. 1957, p. 44-46.
(G4, T24a)

29-G. (Dutch.) **Method for Putting a Linear Network Upon Metal Surfaces.** J. H. Zaat. *Metalen,* v. 12, Oct. 15, 1957, p. 387-390.

A method for applying to a metal surface a linear network (raster) which will adhere well, resist deformation and which has clear and sharp lines. This linear network is used for measuring deformations which occur in nonchipping metalworking. One of the most important applications is the processing of sheet material. (G24b, G24d, L13q)

30-G. (French.) **Ceramic Tools for Turning Operations.** A. B. Albrecht. *Machine Moderne,* v. 51, Oct. 1957, p. 41-45.

Tools made of ceramics and oxides can improve cost prices and production times in high-speed turning operations. The accuracy of the process is extremely good. Powerful machine tools with high accuracy and high speeds are needed. (G17a, T6n; 6-70)

31-G.* (German.) **Rimming Steel.** Heinz Becker and Hubert Hoff. *Stahl und Eisen,* v. 77, Sept. 1957, p. 1215-1220.

Structure, mechanical properties, cutting forces, face wear, abrasion, chip volume and surface roughness during and after machining; effect of the Mn and Pb content on the machinability of free-cutting steel of the rimming type. 4 ref. (G17k, 2-60; ST-d, *Pb, Mn*)

32-G. (German.) **Tool Wear in Machining.** Gustav Vieregge. *Stahl und Eisen,* v. 77, Sept. 1957, p. 1233-1244.

Wear-cutting speed curves as a means of determining the importance of the types of wear in cutting tool life. Influence of feed, process and tool material (toolsteel, stellite, carbides and ceramic) on the material machined (carbon steel and gray iron castings). 10 ref. (G17, Q9; CN, CI-n, TS, 6-69, 6-70)

33-G.* (German.) **Gas Cutting in Modern Production.** H. Christoph. *Schweissen und Schneiden,* v. 9, Oct. 1957, p. 441-447.

Physico-chemical fundamentals; increasing the efficiency of electrical machinery manufacture by use of flame cutting; effect of design of cutting machine; control of cutter head, shape of nozzle; nature of the fuel gas on cutting accuracy. 5 ref. (G22g)

34-G. (German.) **Progress in Stamping Technique.** Hans Krause-Dieter-ing. *VDI Zeitschrift,* v. 99, Sept. 1, 1957, p. 1218-1220.

Influence of sharp and dull cutting edges, sheet tenacity, tool surfaces and lubrication; data for designing and manufacturing dies. 8 ref. (G3, W24n)

35-G. (German.) **Fabrication of Hollow Bodies.** Fritz Singer. *VDI Zeitschrift,* v. 99, Sept. 1, 1957, p. 1223-1226.

Modern methods and machines; use of heat resistant and high-tensile alloys. (G1, G9, G11, W24g; SS, AY, SGA-h)

36-G. (Japanese.) **Sintered Carbide Face Milling Cutters. Pt. 2 and 3.** M. Okoshi and N. Shinozawa. *Scientific Research Institute, Reports,* v. 33, July 1957, p. 185-208.

Power consumption and cutting force with double radial rake. (G17b)

37-G. (Japanese.) **Surface Finish in Fine Turning.** M. Okoshi, T. Sato and A. Kamogawa. *Scientific Research Institute, Reports,* v. 33, July 1957, p. 209-227.

Surface finish in relation to cutting conditions, tools, materials and machine vibration. (G17a)

38-G. (Russian.) **Influence of Hardness and Microstructure of Alloy Castings on Their Machinability.** N. P. Golubkov. *Stanki i Instrument,* v. 28, July 1957, p. 22.

By investigating cutting speeds of various castings a formula was worked out for determining the rate of cutting for given ranges of hardness. (G17k, 5-60)

39-G. (Russian.) **Anti-Galling Drawing Compound for Steel Products.** S. A. Valiev. *Vestnik Mashinostroeniya,* v. 37, June 1957, p. 38-39.

Iron hydroxide in powder form has excellent qualities of dispersion and covers metallic surfaces readily. (G4; NM-h)

40-G. Automation in Roller Bearing Manufacture. *Industrial Finishing, (London),* v. 9, Nov. 1957, p. 927-929.

Tapered roller bearings of Ni alloy steel are given a precision finish by grinding operations on automatic production lines at British Timken Ltd. (G19, T7d; *Ni,* ST)

41-G. Metal Cutting Research. *Iron and Steel,* v. 30, Dec. 1957, p. 647-651.

Investigations into such factors as machine tools and cutting fluids. (G17, A9)

42-G. Cutting Costs With Abrasive Belts and Abrasive Belt Machines. Thomas J. Reid. *Metal Finishing,* v. 55, Dec. 1957, p. 65-66.

(G18, W25s)

43-G.* Fabricating Techniques for Jewelry. Ralph H. Atkinson. *Metal Progress,* v. 72, Dec. 1957, p. 94-98.

Blanking, coining, stamping and pressing are the methods most used for producing jewelry shapes. These, plus soldering and finishing, are the basis of the manufacturing jeweler's craft. (G general, K7, L general, T9s; 17-7; EG-c)

44-G. Extrusion Presses and Press Installations. E. K. L. Haffner and R. M. L. Elkan. *Metallurgical Reviews,* v. 2, 1957, p. 263-303.

18 ref. (G5, 1-52)

45-G. Peening Cuts Stresses in Plated Parts. *Product Engineering,* v. 28, Dec. 9, 1957, p. 92-93.

The peening method pounds surfaces of high-strength steel with shot to neutralize stresses caused by electroplating, especially Cr plating. Peening also prevents cracks and increases fatigue life of parts. (G23n, L17; ST)

46-G. (German.) **Examination of Forming Processes With the Leyensetter Pendulum During the Removal of Metal.** Heinz Vogt. *Werkstatt und Betrieb,* v. 90, Nov. 1957, p. 776-784.

Cutting properties in relation to capacity for deformation, chip brittleness, structure and composition. 11 ref. (G17k, 2-60, 3-71; ST, CI)

47-G. (Russian.) **Investigation of the Effect of Carbide Irregularity on the Grindability of R18 Steel.** E. I. Feldshtein, N. P. Lebedinskii, I. V. Trush and V. S. Kazantsev. *Metallovedenie i Obrabotka Metallov,* no. 7, July 1957, p. 39-42.

Irregularity of carbide distribution affected not only the rate of metal removal but the finish of the surface as well. (G18, 17-52; SGA-j, 6-73)

48-G. Ceramic Cutting Tools. Pt. 1. J. F. Allen. *Canadian Metalworking,* v. 20, Oct. 1957, p. 24-26.

Experiences in using ceramic tools for finishing and roughing cuts on AISI 4130 and other forged steel. (To be concluded.) (G17; ST, SGA-j, 6-70)

49-G. Machining High-Temperature Alloys. A. B. Albrecht. *Machinery,* v. 64, Oct. 1957, p. 149-153.

High-temperature alloys are classified into ferritic, austenitic, age-hardenable and Co-base alloy groups. Composition, machinability ratings, recommended feeds and speeds, tool type and geometry for turning in roughing and finishing operations. Horsepower and coolant requirements for high-temperature alloys. (G17, G19; SGA-h)

50-G. Spark Erosion of Deep Holes on a Wickman Erodomatic Machine. *Machinery,* v. 91, Oct. 11, 1957, p. 867-870.

Features of spark machining technique used for producing long small-diameter holes in Nimonic alloys and heat resistant steels include hollow brass electrode through which dielectric fluid is pumped, rotation of electrode and controlled vibration of work table. (G24a; Ni, SS)

51-G. Forming Integrally Stiffened Wing Panels by Shot-Peening. Kenneth Sparling. *Machinery,* v. 91, Oct. 18, 1957, p. 903-906.

Cast steel shot propelled by high-velocity air jets against flat surface of integrally stiffened wing panels of 7075T6 Al to produce convex shape. (G23n, T24a; Al)

52-G. Rapid Production of Splines by Cold Rolling. M. Etzel and C. E. Kopp. *Machinery,* v. 91, Oct. 25, 1957, p. 961-962.

Cold forming of spline on outboard motor propeller shaft: advantages of process. (G11; ST)

53-G. Cold Extrusion of Steel. B. Kaul. *Machinery,* v. 91, Oct. 25, 1957, p. 963-968.

Developments in technique of forward and backward extrusion; typical shapes obtainable and various stages in production of a steel pressure tube. (G5; ST, 4-60)

54-G. A New Idea in Spark-Machining. James D. Shoemaker. *Machinery,* v. 64, Nov. 1957, p. 147-150.

Inverted electrode spindle and plastic bubble over work area containing dielectric coolant are features. (G24a)

55-G. Heavy-Duty Bending Is a Familiar Sight at Caterpillar Plant. A. W. Johnson. *Machinery,* v. 64, Nov. 1957, p. 158-159.

Plate bending. (G6, 4-53; ST)

56-G. Carbide Tooling and Single-Purpose Lathes Speed Machining of Forged Crankpins. *Machinery,* v. 64, Nov. 1957, p. 173-176.

Machining forged steel automobile crankshafts.
(G17, T6n, T21c; ST, 4-51)

57-G.* Thread Rolling May Be for You. Raymond H. Spiotta. *Machinery,* v. 64, Nov. 1957, p. 181-195.

Defines thread rolling, effects of rolling on mechanical properties, machines and dies for reciprocating flat die thread rolling, planetary thread rolling, in-feed or plunge rolling with cylindrical dies, attachments for thread rolling on screw machines and turret lathes, information on blank feeding, blank design and tolerances and production rates. (G12)

58-G. Use of "Throw-Away" Insert Tooling in Aircraft Production. W. L. Carr. *Machinery,* v. 91, Nov. 1, 1957, p. 1045-1047.

Throw-away carbide tips have advantages of lower costs and absence of heat strain as found in brazed tools. The use of carbide tips in turning, face, and side milling operations on Ti, Al and steel aircraft components.
(G17, T6n, 6-69; Ti, Al, ST)

59-G. AC Hydroforms Sample Stampings. T. C. Barrett. *Machinery,* v. 64, Dec. 1957, p. 144-149.
(G14b)

60-G. Oldsmobile's Rocket Engine Transfer Line. Charles H. Wick. *Machinery,* v. 64, Dec. 1957, p. 156-161.

Output has been increased by new automated transfer machining line. Slower operations have been made more efficient by dividing the work between several heads and machining alternate blocks at successive stations. (G17, 18-74, T2p)

61-G. Chrysler Automates New Stamping Plant. John Nieminen. *Machinery,* v. 64, Dec. 1957, p. 188-193.
(G3, T21; 18-67)

62-G.* Forces in Brake Forming. William W. Wood. *Tooling and Production,* v. 23, Oct. 1957, p. 77-84.

Theory of brake forming and general brake forming equation. Experimental determination of forces in forming steel, Al and Cu in gages of 0.051 and 0.125 in. Correlation of theory with experimental results.
(G1, 10-51)

63-G.* Cold Forming. William E. Hoffman and G. MacF. Tuttle. *Tooling and Production,* v. 23, Oct. 1957, p. 91-122.

Reviews definition, nature of process, principles, examples and possible applications of cold extrusion, impact extrusion, cold forging, cold heading, deep drawing, swaging and thread rolling. Principles of burnishing, roller burnishing, bearingizing, ballizing, ball-broaching, turks head, rolled extrusion, spinning, tube bending roll planishing, roll forming, stretch-wrap forming, shot peening and form and spline rolling.
(G general, 1-67)

64-G. Protective Shot Peening of Propellers. Pt. 3. Fatigue and Distortion. R. F. Broderick, Lesselles and Associates, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131273, June 1957, 109 p. $2.75.
(G23n, T24b, Q7, 9-74)

65-G. (Dutch.) **Investigation and Trial of the Electric Gouging With Carbon Electrodes.** L. Clements. *Lastechniek,* v. 23, Sept. 1957, p. 200-203.

Flame-arc gouging offers advantages. Because of the rapidity of the gouging, the temperature of the workpiece is not appreciably increased but the cooling speed is rather high in the surface of the groove. This may result in surface hardening. (G22)

66-G. British Timken's Techniques in Grinding. Britain's Automatic Factory. Pt. 3. *Metalworking Production,* v. 101, Nov. 15, 1957, p. 2044-2047.

Grinding and handling methods illustrated and compared to bearing plants in America and Russia.
(G18, T7d, 18-74)

67-G.* Taking the Guesswork Out of Grinding and Polishing With Abrasive Belts. Warren K. Seward. *Plating,* v. 45, Jan. 1958, p. 39-44.

Tracking difficulties, contact wheels, mounting the contact wheel on worn spindles, truing and dressing contact wheels and rolls, new type of contact wheel, contact wheel performance, loading and glazing, lubrication of abrasive belts.
(G18, 1-52)

68-G. Making Metal Behave. Carl F. Benner. *Tooling and Production,* v. 23, Nov. 1957, p. 69-73.

Stamping plant experiences and procedure. (G3)

69-G.* Ironing to Improve Your Product and Save Metal, Time and Money. Carter. C. Higgins. *Tooling and Production,* v. 23, Nov. 1957, p. 77-81.

Defines ironing, a cold working process; possibilities and limitations.
(G4)

70-G. (Russian.) **The Soviet Machine-Tool Industry at the 40th Anniversary of the Russian Revolution.** *Stanki i Instrument,* v. 28, Oct. 1957, p. 1-3.

89-G. Titanium Problem Licked by New Hot Spinning Process. *Modern Metals,* v. 13, Dec. 1957, p. 66-67.
(G13, 1-66, T24e; Ti)

90-G.* Titanium Forming. Bill Payne. *RPI Engineer,* v. 10, Jan. 1957, p. 20-23.
Experience with 6Al-4V Ti alloy; best conditions and methods for die, draw bench, roll, hammer, brake forming, spinning operations.
(G general; Ti)

91-G.* Modern Presswork Techniques. T. G. Woodward. *Sheet Metal Industries,* v. 34, Nov. 1957, p. 803-812.
Important factors in design of experimental tooling and strip layout in developing sequence of operation and tools for multi-stage presswork. Technique creates components in strip material while retaining it in strip form in order to progress through various stages of the tools. (G1)

92-G. Need for Specific Sheet-Metal Testing Methods for Deep Drawing and Forming. G. de Witte. *Sheet Metal Industries,* v. 35, Jan. 1958, p. 19-22.
(G4b, Q23q, S general, 4-53)

93-G. Ejection and Handling of Large Components in Pressworking. J. H. Stephens. *Sheet Metal Industries,* v. 35, Jan. 1958, p. 23-34, 54.
Press layout, production costs, conveyors, loaders, the "iron hand", and automation equipment for various types of dies. (G1, W12)

94-G.* Photoetching Forms Thin Parts. *Steel,* v. 141, Nov. 18, 1957, p. 153-156.
Photoetching, in which patterns are printed on coated metal sheets and strips and unwanted portion etched away with acid used for accurately producing thin metal parts. Carbon and stainless steels, Cu, Ni and Al alloys are readily etched. Advantages of process. (G24b)

95-G.* Residual Stresses From Machining Operations. Pt. 1. Erik K. Henriksen. *Steel Processing and Conversion,* v. 43, Nov. 1957, p. 633-635, 639-640, 641.
Reviews literature on residual stresses produced by machining operations. Forces developed between tool chip and workpiece in the mechanism of stress formation. Machining stress data with single-point tools for carbon steels relating machining stress with rake angle and carbon content. Effect of speed and direction of cut on stress accumulation. (To be continued.) (G17, Q25h)

96-G. Cutting Material and Machining Costs With Power Roll Forming. E. W. Bartle. *Tool Engineer,* v. 39, Nov. 1957, p. 107-110.
Power roll forming is a cold rolling process in which material in a blank is caused to flow over rotating mandrel. Series 300 and 400 stainless steels, low-carbon steels, Ni, Ti and Al alloys successfully roll formed; application of process. (G11)

97-G. Solving Machining Problems With Chemical Milling. Arthur Colton. *Tool Engineer,* v. 40, Jan. 1958, p. 119-124.
(G24b)

98-G. Electrical Discharge Machining of Superalloy Turbine Rotor Blades. D. J. MacLean. *Western Machinery and Steel World,* v. 48, Dec. 1957, p. 77-82.
New method of working alloys above normal machining range.
(G24a, T2p; SGB-q)

99-G. Machinability of Cold Drawn Steel Bars. Fred J. Robbins. *Western Metalworking,* v. 15, Dec. 1957, p. 47-49.
Effects of machinability in both metallurgical and mechanical aspects. (G17k, Q general; 4-55, ST)

100-G. (German.) **Deep Drawing of Stainless Chromium and Chromium-Nickel Steels.** Georg Menges and Bernhard Vogelsang. *Industrie-Anzeiger,* v. 79, Aug. 27, 1957, p. 47-52.
Theoretical analysis supported by technical data. 10 ref.
(G4b; SS, *Cr, Ni*)

101-G. (German.) **Manufacture of Precision Slide Bearings.** *Technica,* v. 6, Aug. 16, 1957, p. 885-890.
Surface machining necessary to achieve the best characteristics for various bearings. (To be continued.) (G19, T7d)

102-G. (Italian.) **Cold Bending of Sheet.** P. I. Sandro Spiriti. *Macchine,* v. 12, Nov. 1957, p. 1111-1115.
Formulas for obtaining desired bends; examples. (G6, 4-53)

103-G. (French.) **Surface Phenomena in Drawing Steels Made in Openhearth and Electric Furnaces.** Maurice Vazelle. *Métaux, Corrosion, Industrie,* no. 385, Sept. 1957.
(G4; ST)

104-G. (German.) **Productivity and Economy in Metal Chipping.** E.

Hirschfeld. *Fertigungstechnik,* v. 7, Aug. 1957, p. 345-348.

Amount of surface machined; cutting speed; feed; suitable carbides. (G17, T6n; 6-69)

105-G. (German.) **Liquid Honing Under Pressure.** F. Neuberger, L. Mockel and L. Rötz. *Fertigungstechnik,* v. 7, Sept. 1957, p. 413-416.

Method is recommended for die finishing, scouring and polishing. 6 ref. (G19n, W24n)

106-G. (German.) **Use of Diamond Grinding Wheels.** *Metallwaren-Industrie und Galvanotechnik,* v. 48, Sept. 1957, p. 391-394.

Bonding; proper uses; handlapping. (G18, 1-52; NM-k37)

107-G. (German.) **Advantages and Disadvantages of Turning and Grinding the Grooves in the Rolls of Wire Rod Mills.** Torsten Palm and Hans Warrol. *Stahl und Eisen,* v. 78, Jan. 9, 1958, p. 35-39.

Life of turned and ground rolls. Economic problems in machining rolls. (G17a, G18, W23k)

108-G. (Russian.) **Increase of Finishing Deformation Temperature as Means for Decreasing Load When Stamping Large Billets.** A. V. Altykis and N. I. Belan. *Metallovedenie i Obrabotka Metallov,* Oct. 1957, p. 48-52.

Temperature increase of the billet at the end of stamping from 850 to 1050° C. allows decrease of the load approximately by one half. (G3, 2-61; ST, 4-52)

109-G. (Russian.) **Production Problems of Automobile Sheet Steel for Deep Drawing.** G. D. Rogoza. *Stal',* v. 17, Oct. 1957, p. 941-943.

Non-aging killed steel is recommended for sheet making with sheet hardness control. 5 ref. (G4f, T21a; ST-c)

110-G. (Russian.) **Boring Heat Resistant Steel With Electropolished Bits.** V. V. Monakov. *Vestnik Mashinostroeniya,* v. 37, Sept. 1957, p. 46-47.

Effect of internal surface cleanliness of perforated heat resistant steel workpieces. 5 ref. (G17g, T6n; SS)

111-G. How to Machine Difficult Workpieces. Pt. 1. C. R. Stroup. *American Machinist,* v. 102, Jan. 13, 1958, p. 106-109.

Basic principles, operating techniques and latest advice on applications of electrolytic grinding. (G18, G24d)

112-G. Form Thick Titanium Spheres by Hot Spinning. *Iron Age,* v. 180, Dec. 5, 1957, p. 142-143.

(G13, 1-66, T24d; Ti)

113-G. Fast, Accurate Band Machining Avoids Chip Waste. *Iron Age,* v. 180, Dec. 26, 1957, p. 49-51.

Advantages of cutting, slotting, and shaping with band sawing machines. (G17h)

114-G. Forming Magnesium Skin Panels for Aircraft. H. F. Young. *Machinery,* v. 91, Nov. 8, 1957, p. 1105-1107.

(G4d, T24a, W24g; Mg)

115-G. Production of Aircraft Structural Shapes by Hot Stretching. B. Maloney. *Machinery,* v. 91, Nov. 8, 1957, p. 1107-1108.

(G9, T24a; Al)

116-G. Quantity Production of Fasteners. *Machinery,* v. 91, Nov. 22, 1957, p. 1214-1218.

Blanking, heading, pointing, thread-rolling, thread-grinding and hardening processes are employed in production of steel, brass and aluminum fasteners. (G general, T7f; ST, Al, Cu, *Zn*)

117-G. Production of Integrally-Stiffened Panels for the Vanguard Airliner. *Machinery,* v. 91, Nov. 29, 1957, p. 1244-1253.

Methods and equipment for pressing curvature, shot peening and milling panels. (G4d, G17b, G23n, T24a; Al)

118-G. Turning Operations on High-Temperature Alloys. A. B. Albrecht. *Machinery,* v. 91, Dec. 20, 1957, p. 1431-1434.

(G17a; SGA-h)

119-G. Some Recent Developments in Ultrasonic Machining. *Machinery,* v. 91, Dec. 20, 1958, p. 1443-1444.

Kerry (Ultrasonics), Ltd., has developed a process for cutting internal and external screw threads by ultrasonic vibration. (G24c)

120-G. Production Research in Metal Cutting. M. Eugene Merchant. *Mechanical Engineering,* v. 79, Dec. 1957, p. 1137-1141.

Advantages of unified study of fundamental application of metallurgy, physics, dynamics, physical chemistry and engineering techniques and concepts of metal cutting research. 5 ref. (G17, A9m)

121-G. Inert-Gas Welding Gun Cuts, Then it Welds. *Metalworking,* v. 14, Jan. 1958, p. 3-5.

Trailer manufacturer finds method gives square cut edges at high speed. Eliminates preparation before welding Al plates and frame members. (G22, K1d, 1-52; Al)

122-G. Prestress Raises Steel Performance to New High. *Metalworking,* v. 14, Jan. 1958, p. 10-11.

Increased tensile strength and fatigue life of steel bomb rack hook used in jets.
(G23q, Q27a, Q7b, T2k; ST)

123-G.* Speed Effects in Deep Drawing. H. T. Coupland and D. V. Wilson. *Sheet Metal Industries,* v. 35, Feb. 1958, p. 85-103.

Effects of variations in drawing speed on performance in cup drawing using two distinct punch forms. Behavior of deep drawing quality mild steel and 70-30 brass. Lubricants have been confined to a series of mineral oils and colloidal graphite. (G4b; CN, Cu-n, NM-h)

124-G. Short Run Dies Offer Long Life. *Steel,* v. 141, Dec. 2, 1957, p. 94-96.

Advantages of low-cost dies for blanking, punching, piercing and forming operations. (G3, W24n)

125-G. Chem-Milling Handles Tough Job. *Steel,* v. 141, Dec. 2, 1957, p. 114.

Controlled chemical milling produces complex parts. (G24b, T24a)

126-G. Electrolytic Machining Handles Tough Alloys. *Steel,* v. 141, Dec. 9, 1957, p. 196-200.

(G24d; Co, Ni, SS)

127-G. Case of Molybdenum Disulfide. Harry Simon. *Steel,* v. 141, Dec. 30, 1957, p. 68-69.

Molybdenum disulphide used as a lubricant in tight-fitting assemblies and for lubricating hot drawing and forming dies. (G1, G4, Q9; Mo, NM-h)

128-G. In-Plant "Diamond Mines" Are Expensive—Spot Yours and Save. Carol E. Reuss. *Tooling and Production,* v. 23, Feb. 1958, p. 67-78.

Comprehensive guide to the basic principles of abrasive and diamond wheels; optimum feeds and speeds; comparison with electrolytic, electrospark and ultrasonic grinding; diamond salvage techniques; applications of finish to carbide tools. (G18, 1-52; NM-k37)

129-G. A Cold Answer to Some "Hot" Metal Problems. C. E. Ricketts. *Tooling and Production,* v. 23, Jan. 1958, p. 78-81.

A new high-frequency impact-spin technique for cold dimpling of superalloys. Advantages compared to conventional ram-type dimpling process. (G3, 1-67; Ti, SGA-h)

130-G. Carbide Milling of Steel on Low-Horsepower Machines. Raymond E. Novkov and William B. Stein. *Tooling and Production,* v. 23, Feb. 1958, p. 83-87.

Relative horsepower requirements for various chip loads. (G17b, W25r)

131-G. Factors That Affect the Performance of Coated Abrasives. S. L. Johnson. *Tooling and Production,* v. 23, Jan. 1958, p. 87-90.

Effects of speed, contact, wheel shape and hardness, grit size and type and grinding pressure on the finish obtained with abrasive belt grinding. (G18, 1-52; NM-j)

132-G. Subzero Temperatures Facilitate Production Processes. Robert A. Wason. *Tool Engineer,* v. 40, Feb. 1958, p. 107-115.

Chilling workpieces or coolants reduces cutting time, facilitates machining and improves tool life. New techniques can stabilize and improve metallurgical properties, are valuable also in processing rubber and plastics. (G17, 1-67, 2-63)

133-G. Modern Tube Bending Equipment. G. E. Hart. *Welding and Metal Fabrication,* v. 25, Oct. 1957, p. 392-393.

Fundamental forms of tube bending equipment including forming dies, clamps and mandrels.
(G6, 1-52; 4-60)

134-G. Grinding Wheels for Aluminum. Arthur T. Dalton. *Welding Engineer,* v. 43, Feb. 1958, p. 44.

(G18; 1-52; Al)

135-G. (French.) Technology of Cold Forming of Metals. Pt. 2. R. Molle. *Metallurgie et la Construction Mécanique,* v. 89, Dec. 1957, p. 1021-1027.

Roll forming, deep drawing: techniques, equipment, applications. (Concluded.) (G4b, G11)

136-G.* (French.) Machinability of Steels. E. Bodart. *Revue de la Mécanique,* v. 3, Oct. 1957, p. 125-139.

Methods of determining machinability; measurement of tool life gives results most directly transposable to shop; experimental results obtained by tool life method. No simple correlation is found between any given steel manufacturing process or condition and machinability. 11 ref. (G17k; ST)

137-G. (German.) Features of Development of the Superfinishing Process. K. Wieck. *Das Industrieblatt,* v. 57, Aug. 1957, p. 396-399.

Development of oscillating superfinishing machines. (G19q, 1-52)

138-G. (German.) **Electro-Erosion Apparatus.** G. Barna. *Fertigungstechnik,* v. 7, Dec. 1957, p. 543-549.

Some theories on electro-erosion; design variants in apparatus, their advantages and disadvantages; technology of hard metal coating. (G24a, 1-52, L24)

139-G. (German.) **Scraping of Tooth Profiles. Pt. 2.** G. Rippin and H. Theumer. *Fertigungstechnik,* v. 7, Dec. 1957, p. 569-572.

Experiments with milling and scraping; scraping improves toothwork whereas grinding can interfere; control and the importance of coolants. (G17b; NM-h)

140-G. (Japanese.) **Study on High-Speed Machining. Pt. 8. Effect on Tool-Chip Contact Area on Tool Life.** Hidehiko Takeyama and Eiji Usui. *Journal of Mechanical Laboratory,* v. 11, Nov. 1957, p. 185-188.

At the optimum tool-chip contact area per unit area of cut, the cutting speed can be increased up to 140%. 6 ref. (G17, 3-68)

141-G. (Japanese.) **Study on High-Speed Machining. Pt. 9. Effect of Tool Cutting Conditions on Machining Performance.** Hidehiko Takeyama and Eiji Usui. *Journal of Mechanical Laboratory,* v. 11, Nov. 1957, p. 189-193.

Variation of tool-chip contact area is independent of coefficient of friction of rake face. The contact area is influenced by the metallic affinity between the rake face and the chip. (G17, Q9p)

142-G. (Swedish.) **Turning or Grinding Roll Grooves.** Torsten Palm. *Jernkontorets Annaler,* v. 141, Nov. 1957, p. 790-797.

From point of view of rolling time before rejection there is no difference between turning and grinding of roll grooves on chilled rolls. (G17a, G18, W23k; ST)

143-G. (Swedish.) **Chemical Treatment of Metals.** *Teknisk Tidskrift,* v. 87, Oct. 8, 1957, p. 839-842.

Chemical cutting and punching method; preparation, masking, etching and post-treatment. Economic aspects. 5 ref. (G24b; Al)

144-G. Production Research in Metal Cutting. M. Eugene Merchant. *ASME Paper 57-A-99,* Dec. 1957, 5 p.

Basic method for securing production results in metal-cutting research through unified scientific and engineering approach. 5 ref. (G17, A9)

145-G. Machinability of High-Strength Gray Cast Irons. I. Ham, J. R. Roubik and J. P. Bunce. *ASME Paper No. 57-A-239,* Dec. 1957, 12 p.

11 ref. (G17k; CI-c)

146-G. Roll Forming—Chipless Production. K. W. Stalker. *ASME Paper No. 57-A-271,* Dec. 1957, 9 p.

Cold-forming process for making cylindrical and conical parts. Processing variables and examples of products. (G11, 1-67)

147-G. Chemical Milling of Magnesium. Hugh H. Muller. *Machine Design,* v. 30, Jan. 9, 1958, p. 137-138. (G24b; Mg)

148-G. Aircraft Manufacturing Practice. Pt. 2. A Review of the British Industry. L. G. Burnard. *Machinery,* v. 92, Jan. 10, 1958, p. 97-106.

Pipe bending, sheet metal forming, chemical milling, honeycomb brazing. (G1, G6, G24b, K8, T24)

149-G. New Spark-Machining Technique. J. D. Shoemaker. *Machinery,* v. 92, Jan. 10, 1958, p. 74-76.

Lockheed Aircraft Corp.'s method for finishing cavities of impact extrusion dies. Inverting electrode needle gives rigidity, and coolant flowing in opposite direction of electrode increases machinery speed and improves finish. (G24a, W24n)

150-G. How to Fabricate Stainless Steels. Pt. 1. W. E. McFee. *Metal Products Manufacturing,* v. 15, Jan. 1958, p. 33-35, 68.

Fabrication of various grades, good die practice, die lubricants, annealing, roll forming, spinning, cutting and shearing. (G-general, J23; SS)

151-G. Cutting Fluid Selection. *Metal Progress,* v. 73, Feb. 1958, p. 102-103.

Factors considered include metal to be cut, tool material used, type of operation, quantity of production and cost. (G17, NM-h)

152-G. How to Cut Stamping Costs. *Steel,* v. 142, Feb. 3, 1958, p. 122-124.

Designing for standard practices and tolerances. (G3, 17-51, 17-55)

153-G. (Russian.) **Threading Tubes With Round Screw Dies.** I. A. Gurin. *Metallurg,* Dec. 1957, p. 31.

Semi-automatic machines for threading oil pipes, 6-13 in. diameter, equipped with special conical chuck. (G17f, 1-52, 4-60)

154-G. Behavior of Cutting Fluids in Reaming Steels. L. V. Colwell and Henrik Branders. *American Society*

of Mechanical Engineers, Paper no. 57-A—168, Dec. 1957, 5 p.

(G17e; ST, NM-h)

155-G. Use of Shot Peening to Reduce Weight. W. R. Berry. *Institution of Mechanical Engineers, Proceedings of the Automobile Division*, no. 7, 1955-1956, p. 219-232.

Study of fatigue properties in the finite life range of the commercial silico-manganese spring steel leaves in the normal and shot-peened conditions so as to consider possibility of employing shot-peening as a means of using higher calculated stresses in laminated spring design, thus reducing weight of springs. 5 ref. (G23n, Q7; AY, *Si, Mn*, SGA-b)

156-G. Automatic Flame Profiling of Steel Plate. *Process Control and Automation*, v. 5, Jan. 1958, p. 22-24.

Experimental computer-controlled cutting machine, using magnetic tape input. (G22g; ST, 18-74)

157-G. Chem-Milling Comes of Age. Raymond L. Lewis. *Wisconsin Engineer*, v. 62, Dec. 1957, p. 30-32, 74.

(G24b)

158-G.* (French.) **Oxy-Acetylene Cutting of A52 Steels.** W. Soete and E. Sellier. *Revue de la Soudure*, v. 13, no. 4, 1957, p. 214-226.

Oxy-acetylene cutting of six A52 steels (in thicknesses of 8 to 25 mm.) caused no defects in cut edges. Process hardens the metal. No post-cutting treatment is required prior to welding. Ductility of cut edges is lower than that of metal before cutting, and a pre or post-heating by torch improves ductility. Where a cut edge is to be subjected to strenuous cold deformation, a grinding operation to remove from 1.0 to 1.5 mm. of material is recommended. (G22g, Q23p; AY)

159-G. One Ball, No Errors. *Automatic Machining*, v. 19, Feb. 1958, p. 40-42.

Ballizing process with precision balls of tungsten carbide and chromium alloy steel is solution for hole size and finishing problems.
(G17d, G23n, 1-52; AY, W, 6-69)

160-G. How to Get More From Your High Production Machines. Harry Conn. *Machine and Tool Blue Book*, v. 53, Feb. 1958, p. 113-135.

Concept of "optimation" combines economics, metal cutting research and tool engineering to compute minimum cost, tool life, optimum speeds and feeds, and reduce down time due to tool changes.
(G17, T6n, W25)

161-G. Today They Grind Titanium Routinely. D. S. Foote. *Machine and Tool Blue Book*, v. 53, Feb. 1958, p. 136-140.

(G18; Ti)

162-G. Growing Versatility of Ultrasonic Machining. Jack Welch. *Machinery*, v. 64, Feb. 1958, p. 119-123.

Most successful with harder, more brittle materials difficult to machine by other methods, such as carbide, ferrite, ferramic. Useful in manufacture of dies for type and tread designs for automobile tire molds; machining gem stones; hand engraving; slicing and dicing of Si and Ge for transistors and diodes. (G24c)

163-G. Practical Tooling for Cold Extrusion. Pt. 1. Special Report. John Verson. *Metalworking Production*, v. 102, Jan. 17, 1958, p. 105-113.

Factors for successful impact extrusion of steel; tool design, capacity of press, quality of material, lubrication and shape of slug, knowledge of metal flow. (G5, 1-52, ST)

164-G. Bending Machines Form Precision Parts. *Steel*, v. 142, Feb. 10, 1958, p. 79-82.

Various machines bend thin or heavy wall tubes, intricately flanged extrusions and other shapes to tight radii without wrinkling, bursting or distortion. (G6, 1-52; ST)

165-G.* (German.) **Ceramic Tools for Machining.** H. Opitz and H. Siebel. *Werkstattstechnik*, v. 48, Jan. 1958, p. 2-6.

Applications of ceramic cutting tools in working steel and cast iron. Advantages of some ceramic types in comparison with hard metal, especially in machining gray cast iron. (G17; SGA-j, Al, 6-70)

166-G. (Italian.) **Metallurgy and Machinability of Steels.** Ferruccio Grandi and Athos Masi. *Ingegneria Meccanica*, v. 6, Nov. 1957, p. 17-24.

Influence of hardness, mechanical properties, microstructure, composition, austenitic grain size, heat treatment and cold work on machinability. (To be continued.)
(G17k; ST)

167-G.* Hot Forming Operations on Titanium. *Australasian Manufacturer*, v. 42, Jan. 11, 1958, p. 44-47.

Intricate contours and small-radius bends can be formed. The key to successful processing is controlled heating to temperatures from 300 to 1400° F., depending on the shape of

the finished workpiece and the forming method employed. Individual heating blocks may be used to raise the temperature of the work by a few hundred degrees, or the work itself serves as a resistance heating element and is brought to a red heat. (G1, G9, 1-66; Ti)

168-G. Material Selection for Thread and Form Rolling. *Machine Design,* v. 30, Jan. 23, 1958, p. 137-143.

Rollability and machinability of carbon and alloy steels; nonferrous alloys, Al and Al alloys; finishes obtainable on threaded parts.
(G11, G12, G17k, 17-52; ST, Al)

169-G. Carbide Tools of Special Form for Interrupted Cutting. M. G. Jensen. *Machinery,* v. 92, Jan. 3, 1958, p. 17-18.

Alteration of the normal tool form to include a positive top rake in conjunction with an edge chamfer resulted in satisfactory work finish, accuracy and a saving of time, by comparison with alternative methods of turning with high-speed steel or circular milling.
(G17a, G17b, T6n; 6-69)

170-G. Turbine Blades Reclaimed by Electrolytic Grinding. E. W. Denison and C. V. Ruehrwein. *Machinery,* v. 92, Jan. 3, 1958, p. 31-32.

Cracks on the root flat of turbine blade dovetails have been removed, without altering the depth of penetration, by the electrolytic grinding process using a surface grinder with a 150-grit diamond electrode wheel and electronic control equipment.
(G18, T7h)

171-G. Aircraft Manufacturing Practice—a Review of the British Industry. L. G. Burnard. *Machinery,* v. 92, Jan. 3, 1958, p. 37-47.

Types of routing machines and their applications, including three-dimensional contouring of integrally stiffened forms; wing skin milling; machining of high-tensile steels, Ti, etc., with results obtained using Strasman cutters; systems of numerical control for machine tools.
(G17, T24a)

172-G. (Italian.) **Coining.** Franco Peruzzoti. *Rivista di Meccanica,* Jan. 21, 1957, p. 9-13.

Process; ferrous metals that can be successfully coined; machines used (fly press, toggle press); die design and specifications.
(G3n, 1-52; CI, ST)

173-G. (Book.) **Metal Cutting Tool Nomenclature.** 107 p. 1958. Metal Cutting Tool Institute, 405 Lexington Ave., New York 17, N. Y. $4.50.

Definitions, illustrations and nomenclature arranged by classification. (G17, T6n, 11-67)

174-G.* Chemical Milling: Where and How. Pt. 1. Where to Use Chemical Milling. Jay Sullivan. *American Machinist,* v. 102, Mar. 24, 1958, p. 122-124.

Application of chemical milling outside of aircraft industry. Al, Ti, Mg and steel alloys may be milled by chemical solutions.
(G24b; Al, Ti, Mg, ST)

175-G.* Chemical Milling: Where and How. Pt. 2. How to do Chemical Milling. Ken Clark. *American Machinist,* v. 102, Mar. 24, 1958, p. 125-127.

Procedure for etching Al airplane wing-tip panels. Rate of etching depends on direction of grain, alloy, previous heat treatment, time, temperature, agitation, angle of immersion and spacing of parts in the bath. (G24b; Al)

176-G. How to Get the Best From Ceramics. H. D. Moore and D. R. Kibbey. *Canadian Machinery,* v. 69, Jan. 1958, p. 65-66, 126-127.

(G22g)

270-G.* (German.) **Machines for Electro-Erosion and Examples of Their Use.** F. W. Simonis. *Metall,* v. 12, Apr. 1958, p. 262-268.
Importance of automatic electrode feeding; factors influencing precision and surface quality; review of modern electro-erosion machines; examples of use of electro-erosion in manufacturing tools. (G24d, 1-52)

271-G. (German.) **Milling With Hard Metal Armored Cutter Head on Milling Machines of Old Design.** H. der Wiesche. *Werkstattstechnik und Maschinenbau,* v. 48, Mar. 1958, p. 156-162.
Construction and shape of tools; suitable types of hard metal; optimum working angles (free, chipping, chamfer, edge, setting); sharpening of cutters. (G17b, T6n)

272-G. **Ultrasonic Drill for Boring Small Holes in Hard Materials.** N. K. Marshall. *Industrial Diamond Review,* v. 18, Jan. 1958, p. 17-19.
(G24c, W25p)

273-G.* **The Control of Earing in Aluminum and Its Alloys.** R. T. Thorley and G. E. G. Tucker. *Institute of Metals, Journal,* v. 86, Apr. 1958, p. 353-361.
Earing of sheet produced in the normal manner (i.e., by homogenizing the ingot, hot rolling, cold rolling, and final annealing) has been found to vary according to the finish thickness. The shape of the curve of earing plotted against finish thickness is dependent upon the fabricating conditions and this curve has been used to show the effects of alloy type and composition, preheating, hot rolling, interannealing and cold rolling. 14 ref. (G4; Al)

274-G. **Principles and Applications of Spark Machining.** D. W. Rudorff. *Institution of Mechanical Engineers, Proceedings,* v. 171, no. 14, 1957, p. 495-511.
15 ref. (G24a)

275-G. **Flame-Cutting of Air Hardening Steels.** M. M. Griffith. *International Acetylene Association, Official Proceedings,* 1956, p. 97-99.
(G22g; ST)

276-G. **Looking Ahead With Chemical Milling.** Jay Sullivan. *Machine and Tool Blue Book,* v. 53, May 1958, p. 127-128, 130, 132, 134-136.
Grain orientation and its directional characteristics and the change in the radius of curvature caused by size reduction to be accounted are the most valuable tips to designer. (G24b)

277-G. **Rotary Extrusion Reduces Costs and Saves Material.** J. Genis and W. Mallindine. *Machinery,* v. 64, Apr. 1958, p. 115-121.
Processes and equipment used for reduction in metal thickness; titanium, steel and others; deformation under pressure up to 50,000 psi. Metal thickness reduced 75% in one pass; different types of rotary extrusion and results obtained.
(G5, G11, G13, T24b; Ti, ST)

278-G. **Man Made Industrial Diamonds for Grinding Wheels.** N. A. Matthews and Norman Leventhal. *Machinery,* v. 64, Apr. 1958, p. 122-127.
Results of tests comparing natural and man-made diamonds; laboratory tests and tables. Applications and limitations. (G18, W25c; NM-k37)

279-G. **Carbide Tooling on Automatics.** *Machinery,* v. 64, Apr. 1958, p. 128-131.
Use of tungsten carbide tools in outer cups for nickel-alloy steel roller bearing production at Duston, England, plant of British Timken Ltd. Processes and details.
(G17b, T7d; AY, W, 6-69)

280-G. **Double End Machining of Unwieldly Castings.** Robert Kennedy. *Machinery,* v. 84, Apr. 1958, p. 140-141.
(G17; CI-s)

281-G. Economical Small-Lot Machining of Large Parts. *Machinery,* v. 64, Apr. 1958, p. 150-154.

Heavy steel weldments and castings for road building equipment processed on special machines. Floor space savings of up to 80% and reductions in capital equipment costs of 50% are possible with these multiple-purpose machines. Operations and results.
(G17, W25; ST, 5-60, 7-51)

282-G.* Forming Titanium Extrusions. I. J. Wilson. Digest of paper given before Titanium Conference, Western Metal Congress, Mar. 1957. *Metal Progress,* v. 73, May 1958, p. 188-189, 192.

Titanium extrusions can be successfully formed by observing five points: take proper steps to secure a good surface condition; form at room temperature or above 1250° F.; do not exceed the limited shrink and stretch allowables; use a generous bend radius; use good tooling.
(G-general; Ti, 4-58)

283-G. High-Speed Coining. Robert M. Johnson and James Mourning. *Metalworking Production,* v. 102, Apr. 25, 1958, p. 724-725.

(G3n, Mg)

284-G. Cutting With Ceramics. Charles E. Penaz. *Northwestern Engineer,* v. 17, Feb. 1958, p. 24-26, 60.

New advance in cutting tool technique. Use of ceramic tool bits. Superiority of ceramic tools over carbides. They can cut at much higher speeds, better finishes, longer tool life and coolants are generally unnecessary.
(G17, T6n; SGA-j; 6-70)

285-G.* Use Chemical Milling to Make Light, Close-Tolerance Parts. Charles H. Lundquist. *Precision Metal Molding,* v. 16, Apr. 1958, p. 54-57.

Application of chemical milling techniques to cast Al, Mg, Ti or steel. Tolerances and surface finishes to be expected.
(G24b; Al, Mg, Ti, ST)

286-G. Enamel Glasses as Lubricants for Forming Sheet Metal. A. Hegarty. *Scientific Lubrication,* v. 10, Feb. 1958, p. 12-13, 24.

Use of low-melting glasses in molten conditions as lubricants.
(G4; NM-h, NM-f42)

287-G. New Machine Whips Contouring Job. *Steel,* v. 142, May 12, 1958, p. 90-91.

Machine to mill jet turbine blades automatically uses rectangular bar stock, operates on principles similar to automatic screw machines.
(G17b, T7h)

288-G. Plastics in Plant Tooling. Otokar F. Bernardin. *Tool Engineer,* v. 40, May 1958, p. 85-88.

Plant experience shows that plastic tools, jigs, fixtures and gages give good performance at a considerable saving over comparable metal tools. (G-general, NM-d)

289-G. Determining Tool Life on Nodular Cast Iron. Gerhard Hug. *Tool Engineer,* v. 40, May 1958, p. 97-103.

Comparative tests indicate that increasing nodular graphite improves machinability markedly. Also, larger nose radii, consistent with finish, are desirable. (G17; CI-r)

290-G. The Arcair Torch. T. D. Warren. *Welding and Metal Fabrication,* v. 26, Feb. 1958, p. 67-70.

A metal-cutting process in which an arc is drawn between a carbon electrode and the workpiece.
(G22h, W29d)

291-G. Grinding of Hard Metals With Electrically Conducting Abrasives, Using Graphite as a Filler. I. K. Trushin. *Vestnik Mashinostroeniya,* v. 37, no. 5, 1957, p. 59-61. (Henry Brutcher, Altadena, Calif., Translation no. 4105.)

(G24a)

321-G.* **Property of Free Machining.** K. G. Lewis. *Iron and Steel,* v. 31, May 1958, p. 179-183.

Effects of various cutting fluids on machinability and cutting performance of sulphurized or leaded steels. Effect of Pb and similar metallic additives on machining characteristics, structure and mechanical properties of alloy steels, Cu and Al alloys; importance of graphite in machining cast iron; development of free machining properties by means of cold working and heat treatment. (Concluded.) 15 ref. (G17k, 2-60; ST, CI, Cu-b, Al-b, *Pb, S,* NM-h)

322-G.* **The Forming of Flanged and Dished Heads.** H. S. Beers. *Iron and Steel Engineer,* v. 35, May 1958, p. 110-114.

Special machines at Colorado Fuel and Iron Corp. form hemispherical, elliptical or conical heads in steel, stainless, Cu, Ni, Al and their alloys from starting materials over 3/16 in. thick. (G13; SS, ST, Cu, Ni, Al)

323-G. **Machining Blades for Gas Turbine Units.** *Machinery (London),* v. 92, May 1958, p. 1082-1094.

(G17, T7h)

324-G. **Roll Forming Highway Guardrail.** *Modern Industrial Press,* v. 20, May 1958, p. 17-19.

Coil stock of hot rolled, Zn coated 12-gage steel strip punched and formed to "deep beam" guardrail on a continuous line. (G11; ST, 4-53)

325-G. **No-Draft "Pressings" Save Three Ways.** Collins Fuqua. *Modern Industrial Press,* v. 20, May 1958, p. 27-28.

"Pressings" produced by placing pretrimmed blank on a heated mating die and applying sufficient pressure to make metal flow. Mg and Al alloys pressed under conditions similar to conventional forgings do not require draft angle allowance. Machining costs reduced; less processing space and less raw materials. (G1; Al-b, Mg-b)

326-G. **Aluminum Tubing Saves Machining Costs, Weight, Over Solid Bar Stock.** *Western Metalworking,* v. 16, May 1958, p. 52-53.

(G17; Al-b, 4-60)

327-G.* (German.) **Cold Die Sinking of Steel.** K. E. Thelning. *Werkstatts-*

technik und Maschinenbau, v. 48, Apr. 1958, p. 209-215.

Free sinking using cylindrical ram; sinking with holding ring; relationship between sinking depth and hardness of material and diameter of ram. Other factors influencing sinking depth. Practical examples. (G16; ST)

328-G. (Japanese.) **Soviet Metalworking Technology.** Ketsu Inoue. *Metals,* v. 28, Apr. 1958, p. 260-264.
(G17)

329-G. **Slice and Electrogrind Honeycomb for B-52 Panels.** William G. Koehler. *American Machinist,* v. 102, June 16, 1958, p. 93-95.
(G17b, G18, T24b; Al, SS, 7-59)

330-G.* **High Speed Machining. A New Concept.** William E. Montgomery. *Carbide Engineering,* May 1958, p. 9-11.

New titanium carbide uses Ni as a binder and contains molybdenum carbide as an alloy carbide addition. Typical applications. (G17; SGA-j; Ti, 6-69)

331-G.* **Hot-Sizing Titanium and High Temperature Steel Parts.** Charles O. Herb. *Machinery,* v. 64, June 1958, p. 118-121.

Hot sizing presses eliminate wrinkles and warped surfaces from cold formed parts of titanium and stainless steel. Workpiece can range from 0.005 to 0.093 in. thick. Less than 8% of the time needed formerly with bench work is required. (G1; Ti)

332-G.* **Applications of a Verson-Wheelon Press in the Production of Helicopter Parts.** *Machinery, (London),* v. 92, June 6, 1958, p. 1345-1350.

Method of operation of the machine, which is rated at 10,800 tons. The workpiece is placed on a form block, and pressure is applied, through a thick rubber working pad, by means of an inflatable rubber bag, in which an oil pressure of 5000 psi. is exerted. (G14a, W24g)

333-G.* **Titanium Fabrication.** L. P. Spalding. *North Atlantic Treaty Organization Advisory Group for Aeronautical Research and Development,* Report 96, 1957, 33 p.

Detailed survey of material preparation, forming (bending, stretch forming, drop hammer forming, deep drawing), machining, chemical milling, heat treatment, cleaning and pickling, welding and salvage. 8 ref. (G-general, J-general, K-general, L-general; Ti)

334-G.* **Shotpeening Effects and Specifications.** Henry O. Fuchs. Paper from "Metals", ASTM STP No. 196, p. 22-32.

Specifications for shot are concerned with material, shape and size. The specifications of the shot stream intensity are based on the measurement of residual stress effects in a standard sample—the Almen strip; by a standard instrument —the Almen gage. 8 ref. (G23n)

335-G.* (French.) **Ultrasonic Machining.** M. Deribere. *Mecanique,* v. 42, Feb. 1958, p. 59-63.

Principle of ultrasonic machining; abrasives used; metals machinable by this method; machines and tools employed. 23 ref. (G24c)

336-G.* (German.) **Machining of Titanium.** Hans D. Weckener. *Das Industrieblatt,* v. 58, Apr. 1958, p. 119-123.

Physical properties of Ti. Composition of the most important Ti alloys and mechanical properties of some of them. Special conditions of boring, threading, reaming, milling, grinding and sawing. Examples of machining. (G17; Ti)

337-G.* (German.) **Argon Arc Flame Cutting of Nonferrous Metals.** *Das Industrieblatt,* v. 58, Apr. 1958, p. 167.

Peculiarities of arc cutting of nonferrous metals. Cutting method using argon and hydrogen. Cutting speed and gas consumption in case of manual and mechanical burner feed. (G22h)

338-G. (Russian.) **Oxygen-Arc Cutter for Carbon Steels.** *Stanki i Instrument,* Mar. 1958, p. 43.

Electrically heated oxygen cutter using an ordinary carbon electrode. Oxygen is led to the hot metal through a tube resembling an ordinary cutting torch. An eye shield is attached to the cutter. D.C. current of 200 amp. may be supplied by the usual welding generator. (G22; CN)

339-G. (Russian.) **Cutting Forces in the Machining of Aluminum Alloys.** E. I. Feldshtein. *Vestnik Mashinostroenia,* May 1958, p. 62-65.
(G17; Al-b)

340-G. (Russian.) **Modern Methods in the Electro-Erosion Machining of Metals.** B. R. Lazarenko and N. I. Lazarenko. *Vestnik Mashinostroeina,* May 1958, p. 65-69.
(G24a)

341-G. (Russian.) **Some Problems Relating to the Physical Character of Ultrasonic Machining.** I. S. Vainshtok. *Stanki i Instrument,* Apr. 1958, p. 13-14.

(G24c)

342-G.* **Factors Influencing the Performance of Grinding Wheels.** E. J. Krabacher. *American Society of Mechanical Engineers,* Paper No. 58-SA-40, 1958, 7 p.

Measured wear may be translated into terms of grinding ratio. This generally accepted parameter for measuring wheel wear is the ratio of the volume of metal removed per unit volume of wheel worn away. Grinding ratio decreases with increased metal-removal rate and increases with workpiece diameter, decreased chip load, and increased concentration of grinding fluid. 5 ref. (G18, Q9)

343-G. **A Study of the Effects of Tool Flank Wear on Tool Chip Interface Temperature.** D. R. Olberts. *American Society of Mechanical Engineers,* Paper No. 58-SA-41, 1958, 5 p.

Effect of land wear upon the interface temperature between a carbide tool and an AISI 1015 steel workpiece. (G17, Q9, CN)

344-G.* **Controlled Contact Cutting Tools.** B. T. Chao and K. J. Trigger. *American Society of Mechanical Engineers,* Paper No. 58-SA-42, 1958, 9 p.

A substantial reduction in power consumption, an increase in tool life, more effective utilization of cutting fluids and improved surface finish on the machined workpiece have been achieved by suitably controlling the length of tool-chip contact. Reasons for these findings discussed in terms of basic variables in chip formation mechanics. 15 ref. (G17)

345-G.* **Beryllium Machining Characteristics.** Donald R. Walker. *American Society of Mechanical Engineers,* Paper No. 58-SA-43, 1958, 6 p.

Beryllium chip formation is predominantly a brittle fracture process irrespective of the cutting speed, feed or tool geometry used; however, some plastic flow of the chip is observed. Chip uniformity and surface finish improve with light feeds and high tool rake angles. Surface cracking, stick-slip friction and built-up-edge formation on cutting tools are phenomena associated with Be cutting. 5 ref. (G17; Be)

346-G.* **The Effect of a Lead Additive on the Machinability of Alloy Steels.** Norman Zlatin and John V. Gould. *American Society of Mechanical Engineers,* Paper No. 58-SA-53, 1958, 6 p.

Results of turning tests, using carbide tools, on AISI 4147H and AISI 4340H plain and leaded steels at different hardness levels. Data demonstrate at what hardness levels the lead additives are most effective. (G17k, 2-60; AY, *Pb*)

347-G.* **Concentrated Wear of Turning Tools.** V. Solaja and D. R. Cliffe. *Metal Treatment and Drop Forging,* v. 25, May 1958, p. 187-190.

Experiments on cutting carbon steel with carbide-tipped tools demonstrate influence of work-piece surface condition on intensity of localized wear and groove formations. Relation between tool wear and deformation of surface layer. 8 ref. (G17, Q9; CN)

348-G.* **Chemical Milling: How to Do It.** Ken Clark. *Metalworking Production,* v. 102, May 30, 1958, p. 947-949.

Detailed steps of masking, trimming, etching variables, etch bath procedures. (G24b)

349-G. **Steel Fabrication Lighter Than Aluminum.** James B. Teeter and R. Rohrberg. *Metalworking Production,* v. 102, May 30, 1958, p. 950-951.

Anti-icing nozzles for fighter planes are now made of stainless steel instead of Al. Stronger material reduces manufacturing costs 27% and cuts weight 50%. Nozzles are formed in halves, then welded together. (G-general, Kld; SS)

350-G. **Drilling and Reaming With Gun Type Tools.** Herbert Gregg. *Tool Engineer,* v. 40, June 1958, p. 79-84.

(G17e, W25p)

352-G. (German.) **Bending of Aluminum Tubes and Sections.** W. Hegmann. *Aluminium,* v. 34, May 1958, p. 266-276.

(G6; Al, 4-60)

353-G.* (Russian.) **Electro-Erosional Properties of Metals.** A. S. Zingerman. *Fizika Metallov i Metallovedenie,* v. 5, no. 1, 1957, p. 58-67.

Electro-erosion is produced by heat transferred through the discharge canal of an electrode. The erosion is in proportion with the

discharged energy and its duration. The dependence of critical energy on critical duration appears to be the limit of electrical erosion. 9 ref. (G24a)

369-G. (Book.) **Techniques of Pressworking Steel Metal.** Donald F. Eary and Edward A. Reed. 472 p. 1958. Prentice Hall, Inc., 70 Fifth Ave., New York 11, N. Y. $12.

Press types, sheet-metal operations, mechanical handling devices, toolsteel. Emphasis is on die design. (G1, W24n; ST)

370-G.* (French.) The Four-Slide Press or Progressive Dies? J. H. van der Burgt. *Machine Moderne,* v. 52, May 1958, p. 9-20.

Four-slide press provides following advantages for fabrication of thin-wall metal parts: less waste of metal, less risk of tool breakage, longer tool life, lower labor costs,

lower tool maintenance costs, closer tolerances. Less set-up time is required and die costs are usually lower for same work done with progressive die; however, if lot is big enough, cost of set-up time and tooling per part will be lower for work done on press. Details for parts in steel, nickel and nickel-steel machined by both methods.
(G1, W24g; ST, Ni)

371-G.* (Japanese.) **Ultrasonic Cutting.** J. Kumabe and M. Masuko. *Japan Society of Mechanical Engineers, Transactions,* v. 24, Feb. 1958, p. 109-114.

Ultrasonic two-dimensional cutting using vibrated bite. The frequency is 18.4 KC (constant), amplitude is variable; technique may be applied to aluminum, brass, mild steel or cast iron. (G24c)

372-G.* **Developments in Propane Torch Metal Cutting.** J. R. M. Barclay. *Engineer and Foundryman,* v. 22, Apr. 1958, p. 64-66.

Benefits derived from propane cutting include: reduced gas costs; no flashbacks or popping, with consequent long tip life and minimum cutter maintenance costs; quicker starting and a narrower kerf, resulting in higher cutting speeds; less slag and cleaner edges, which mean a saving in workshop time and labor; less cylinder handling. (G22)

373-G.* **Carbide and Ceramic Tools in the Finish Turning of Steel.** Vladimir Solaja. *Institution of Production Engineers, Journal,* v. 37, June 1958, p. 363-372.

In spite of the fact that the chemical, physical and mechanical characteristics of ceramic tools differ considerably from those of carbide tools, the interesting phenomenon of concentrated tool wear in finish turning of steel (i.e., the formation of grooves at the boundaries of interfaces clearance face/workpiece and rake face/chip) is a characteristic phenomenon in both cases. 16 ref. 436-G. (French.) Effect of Peening With a Gun on the Tensile Fatigue Strength of Butt Welded Joints and Plates With Welded Connections. *Soudage et Techniques Connexes,* v. 12, May-June 1958, p. 231-236.

Weld peening carried out by compressed air gun controlling a multiple tool made up of a bundle of separate needles. Repeated tensile fatigue tests show that the improvement due to the operation may be 35% at least. In particular, the strength of the weakest assemblies (plates with welded connections) can thus be brought to the level of the strongest ones (butt welded joints), when no peening has been performed. (G23n, Q7; 7-51)

440-G.* The Effect of Grinding on Fatigue Strength. *Australasian Manufacturer,* v. 43, June 14, 1958, p. 78-84.

Good commercial grinding practice did not lower the fatigue limit even though moderately high tensile stresses were generated during grinding. Severe grinding did cause a drop in the fatigue limit, but this was much less than might be expected in view of the high tensile stresses present. Under certain grinding conditions in which grinding oil was used, the surface was actually strengthened enough to raise the fatigue limit appreciably above its normal value. (G18, Q7)

441-G. Milling Titanium Alloys. *Mechanical World and Engineering Record,* July 1958, p. 302-304.

Avoid butt-mill applications (high-speed steel and carbide); use helical carbide slab mills (45° recommended); apply coolant liberally, using sulphur-base oil flow or spray mist coolants; check closely on cutting tool wear, removing dull tools immediately. (G17b; Ti-b)

491-G. The Cold Roll-Forming Process—and as Applied to Semi-Austenitic Stainless Steels. Frank Jacobs. Paper from "Sheet Materials for High-Temperature Service", American Society for Metals, 1958, p. 51-68.

Cold roll-forming of 17-7 PH and PH 15-7 Mo stainless steel sheet and plate has been accomplished with reductions up to 65% in one pass of the roller. Cylindrical blanks machined from 17-7 PH bar stock were cold reduced up to 47.5%. Tensile properties which resulted from roll forming; effect of subsequent heat treatments upon the roll-formed material to develop additional strength in the formed part. 13 ref. (G11, SS)

492-G.* (German.) **Roll Spinning of Cone-Shaped Aluminum Parts. Pt. 2.** H. Reichel. *Fertigungstechnik,* v. 8, June 1958, p. 252-260.

Mathematical studies carried out with the help of an experimental machine to determine the values of the feeding force, measured axially, and of the reacting force, measured

radially to the chuck. Relationship between these forces, the chuck and roll radii, the distance roll to chuck, roll velocity and feed. Feed limits determined, feeding and reacting forces varying with the thickness of material and its properties. (G13; Al)

493-G.* (German.) **Smoothing and Reworking of Center Bores With Cone-Shaped Grinding Tools.** Artur Schatz. *Werkstattstechnik und Maschinenbau,* v. 48, July 1958, p. 349-354.

Special grinding machines and operations for eliminating defects in center bores. Bores with minor defects are smoothed with grinding tools providing surface contact with the bore. Heavier imperfections are reworked by grinding with linear contact between tool and bore. In the latter case either the part is given a circular movement, leaving the spindle axis stationary, or the part stays at rest and the spindle axis describes a circular path. The grinding cone can be shaped by built-in devices. (G17d, 1-52)

494-G.* **Abrasive Cutting.** *Draht (English Edition),* no. 35, June 1958, p. 28-31.

Advantages of abrasive cutting for parting wire rope, cable, rod, tube, sheet or plate. Cutting wheel selection, limitations on workpiece size; features of Swiss and German abrasive cutting machines. (G17; NM-j)

495-G.* **Some Experiments on the Impact Extrusion of Aluminum, Copper and Steel.** D. F. Galloway. *Machinery (London),* v. 93, Aug. 13, 1958, p. 356-372.

Preparation of slugs, tools and equipment, variations of extrusion force with punch penetration, effect of wall thickness on extrusion force, effect of slug temperature and metal flow during reverse extrusion. (G5; Al, Cu, ST)

496-G. Precision Machines Slice and Dice Transistor Elements. Charles Emerson. *American Machinist,* v. 102, Sept. 8, 1958, p. 85-86.

High surface speeds and slow feeds allow precision cutting of small brittle crystals. Ultrasonic techniques also used for high accuracy. (G17k, G19, T1k; EG-j31)

523-G. **Research Into Deep Drawing.** G. Murray. *Sheet Metal Industries,* v. 35, Sept. 1958, p. 657-675.

Theories of the deep drawing process; tests for the assessment of deep drawing properties. (G4b)

524-G. **Designing for Production.** J. V. Harding. *Sheet Metal Industries,* v. 35, Sept. 1958, p. 676-677, 684.

Ease of manufacture considered as a factor in parts design. (G3; 17-51)

525-G. (Russian.) **Experiments in Using Disks for Hot Sawing.** V. V. Tatarnikov. *Stal',* v. 18, Aug. 1958, p. 716-717.

Best results obtained when hardness of cutting teeth was Rockwell C-55 to 60. Annealing lengthens service span by 15%. Use of steel with tensile strength of 70-80 kg. per sq. mm. is recommended. (G17h, W24m; ST, 2-64)

526-G.* **Impact Extrusion of Steel Wrist Pins.** *Precision Metal Molding,* v. 16, Oct. 1958, p. 40-42.

Steel used is AISI 5015, cold drawn and annealed. Billets are phosphate coated and lubricated with a soap-like material and then extruded. Web removal, hardening and grinding follow the extrusion process. (G5, T21b; ST)

527-G.* **Eliminating Edge Breaking by Ultrasonic Cutting.** Burton B. Stuart. *Grinding and Finishing,* v. 4, Aug. 1958, p. 34-35.

Ultrasonic cutting head mounted on new-design suspension system cuts brittle ferrites, semiconductor materials with sharp corners, low reject rate. (G24d; EG-j31)

528-G.* **Oxy-Gasoline Cutting Torch Works Fast, Lowers Cost.** William Czygan. *Iron Age,* v. 182, Oct. 23, 1958, p. 66-67.

A new flame torch cuts through ½ in. steel at 30 ips. on just 12 cc. of gasoline and 48 liters of oxygen. Savings result in fuel, reduced labor, storage and handling costs. There is little or no slag left. (G22g)

529-G.* **Completely Carbide.** C. R. Morgan. *Automatic Machining,* v. 19, Oct. 1958, p. 37-39.

Carbide can increase production on turret lathes and similar chucking-type turning machines so the advantage should be multiplied on single and multiple-spindle automatics, where many tools are employed, and where tool tending time is a major factor in production costs. (G17a; SGA-j, 6-69)

530-G. **Draw Die Forms Tapered Parts.** Charles Myers. *Iron Age,* v. 182, Oct. 9, 1958, p. 86-87.

A 259-in. tapered strip drawn into complex cross section by using die with movable segments, controlled by part thickness. (G4, W24n, 1-52)

531-G. **Electro-Chemical Machining.** *Machine and Tool Blue Book,* v. 53, Oct. 1958, p. 129-132, 134.
(G24d)

532-G. **Faster Hobbing of Gears With More Accuracy.** A. Budnick. *Metalworking Production,* v. 102, Sept. 26, 1958, p. 1686-1689.
(G17b, T7a)

533-G. **Trends in Gear Cutting and Finishing Processes.** A. Sykes. *Metalworking Production,* v. 102, Sept. 26, 1958, p. 1692-1694.
(G17g, T7a)

534-G. (French.) **Manufacturing Precision Telescope Parts.** A. Blanken. *Machine Moderne,* no. 592, July 1958, p. 17-19.

In the manufacture of precision parts, telescopes are used as alignment instruments, allowing measurements within 0.02 mm. Finish machining and testing of telescope tubes. (G17, X3)

535-G.* **Pivot Polishing.** Walter I. Shanler. *Automatic Machining,* v. 19, Oct. 1958, p. 40-43.

Small precision part is accurately sized (for both diameter and shoulder lengths) and is given an

extremely fine surface finish on a practical basis. Pivot superfinishing is a chip removing operation somewhat related to cylindrical grinding. The grinding wheel itself is replaced by a specially ground carbide or ceramic superfinishing wheel. (G19q)

536-G.* Hot-Sizing Titanium Shapes at Ryan Aeronautical Co. Charles O. Herb. *Machinery,* v. 65, Oct. 1958, p. 122-124.

Use of hot dies and stretch forms insures accurate shape and size of parts made from commercially pure Ti and alloys that are hard to form. (G9, 1-52: Ti)

537-G.* Slicing and Dicing Crystals of Silicon and Germanium. *Machinery,* v. 65, Oct. 1958, p. 128-130.

Si and Ge crystals for application in military, airborne and industrial electronic systems and controls are produced. Methods developed for mass-producing these parts to dimensions of 0.035 in. square by 0.013 in. thick within a tolerance of ± 0.002 in. (G17; Si, Ge)

538-G.* Hot-Sizing Titanium and Heat-Resistant Steel Parts. *Machinery (London),* v. 93, Oct. 1, 1958, p. 762-764.

It is difficult to produce small corner radii in such metals, and when parts have been formed in hydraulic presses, or by drop-hammers, they almost invariably have wrinkled flanges and warped surfaces. To overcome these difficulties, several prototype hot sizing presses have been developed. On these machines, parts are hot sized in less than 8% of the time formerly required for bench working, and dimensional limits of the order of ± 0.003 in. can be maintained. (G9, 1-52; Ti, SS)

539-G.* Glass Lubricants in Metallurgy. L. K. Kovalev and V. A. Ryabov. *Metal Industry,* v. 93, Sept. 26, 1958, p. 249-251. (From *Steklo i Keramika.*)

Glass lubrication is being used increasingly in metalworking, particularly in hot pressing, stamping, boring and in the hot shaping of high-alloy steels, Mo, V, Zr and Ti. (G-general; NM-h, NM-f43)

540-G.* Cold Heading and Upsetting. G. H. Townend and F. B. Wilson. *Metal Treatment and Drop Forging,* v. 25, Sept. 1958, p. 353-359.

Methods and machines for production of cold headed parts; suitable materials. Process is widely used in manufacture of fasteners; small bolts, for example, at the rate of 200 per min. The most commonly used material is carbon steel. (G10, 1-67, T7f; CN)

541-G.* Precise Methods Make Transistor Elements. Charles Emerson. *Metalworking Production,* v. 102, Oct. 10, 1958, p. 1789-1790.

Ultra-small pieces of Ge, Si and other semiconductor materials are machined and finished with careful laboratory techniques. Improved methods of cutting and finishing the unusual materials, which are hard and brittle, include slicing thin wafers from a single-crystal ingot with diamond saws; dicing the wafers into tiny squares of material with a single or ganged saws; lapping and polishing the faces of the wafers and dice to a high accuracy; ultrasonic machining faces to special shapes. (G17, T1k; Ge, Si, EG-j)

542-G.* Gun Drilling Solves Concentric Cavity Machining Problem. *Modern Machine Shop,* v. 31, Nov. 1958, p. 150-152.

The part to be drilled was a small disk of cold rolled steel with Zn plating. It required a concentric cavity with 45° sides. A solid carbide-tipped gun drill, 7 in. long, was made with the carbide point sharpened to fit the contours of the depression in the disks. This took advantage of the characteristics of all gun-type tools; free cutting at minimum end pressure, designed to cut to center and use of hard grade of carbide. (G17e; ST)

543-G.* Ultrahigh Speed Machining. Solution to Producibility Problems? Robert L. Vaughn. *Tool Engineer,* v. 41, Oct. 1958, p. 71-76.

Need for new machining methods for aircraft parts; machining variables; reasons for metal failure; plastic deformation in solids; results of experiment with explosive machining at 150,000 ft. per min. were favorable. (G17, G19)

544-G.* Power-Roll Forming: Machining Without Chips. John N. Heater. *Tool Engineer,* v. 41, Oct. 1958, p. 99-102.

Power-roll forming, also called hydrospinning, floturning, flow forming and power spinning, is a fast and accurate method of forming cones, tubes and other shapes. Characteristics and applications of the process as well as basic theory.

Chipless machining is possible with this process, which forms parts to close tolerances by rotary extrusion. (G11, G13)

545-G.* Evaluating the Producibility of Cold-Extruded Parts. R. W. Gardner. *Tool Engineer,* v. 41, Oct. 1958, p. 105-107.

When producibility considerations are taken into account, the ability of the cold extrusion process to shape parts to finished dimensions with few secondary operations can be fully exploited. Points which are important in considering cold extrusion of steel as a manufacturing process are tool design, product geometry or shape, product material and lubrication. Thus, depending upon conditions, cold working is either an advantage or a disadvantage. (G5)

546-G.* (Japanese.) **Forming Gears on Rotary Hot Presses.** M. Naruse. *Metals,* v. 28, Sept. 1958, p. 683-691.

Uncut wheel is heated by high-frequency heater, which consists of circular coil for preheating and of quadrant coils for the working process. Rim of a wheel is heated by 400 kc. alternating current. (G17g)

547-G. Metallic Carbide Tools. G. Villani. *Revue Mecanique,* v. 7, no. 130, 1956, p. 27-33. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. 58-1430.)

(G17, T6r, 6-69)

548-G.* Machining Operations on Honeycomb Material. *Machinery (London),* v. 93, Oct. 15, 1958, p. 903-906.

The honeycomb core is attached to a skin or "caul plate" with polyethylene glycol, a water-soluble wax-like material which has excellent gripping properties at room temperature but can be melted and removed from the work by washing in hot water. To machine the honeycomb, a "truck-valve" type of cutter is used. A manually controlled Wadkin router, with a 25-ft. long table; planer-type machine for producing wedge-shaped honeycomb parts. (G17, 7-59)

549-G.* (German.) **Thread Rolling.** Karl Schimz. *Werkstatt und Betrieb,* v. 91, Sept. 1958, p. 538-544.

Rolling with flat tools, with driven round tools, and with nondriven tools. Changes in material and its properties, suitability of different materials, accuracies obtainable, quality of surface finish, economy of the single methods. 12 ref. (G12)

550-G.* (German.) **Thread Skiving.** Ernst Linsinger. *Werkstatt und Betrieb,* v. 91, Sept. 1958, p. 545-550.

To calculate the cutting data in thread skiving a simple formula is given for the "Komma-factor", the ratio of the peripheral feed to the maximum thickness of chips. Output investigations based on the volume machined in the time unit, to the choice of the driving motor, the influence of the specific cutting power, choice of the cutting angle, construction of tools, down-cut or climb-cut operations, respectively, demands on the lathe to be used, questions of cooling, the choice of the cutting speed for different materials. (G17f)

551-G.* (German.) **Strip Drawing Operations.** J. Thorwarth. *Werkstatt und Betrieb,* v. 91, Sept. 1958, p. 572-577.

Follow-on drawing operation for parts having a large diameter, developed from the Oeillet method. Theoretical fundamentals, calculation of a tool for drawing in the single-row strip; comparison of costs with individual drawing method; drawing in multiple-row strips and with freely cut sheet or bars. 5 ref. (G4)

552-G.* (Japanese.) **Behavior of Chips in Steel Cutting.** K. Okushima and K. Minato. *Japan Society of Mechanical Engineers, Transactions,* v. 142, no. 24, 1958, p. 333-339.

Flow-out angle of chip and shape of chip studied for various cutting speeds, thrust and nose radius. Effects of the first two are not appreciable, but the larger the nose radius, the larger the flow-out angle. Chips are classified into the continuous type and the chop type. (G17; ST)

553-G.* (Japanese.) **Researches on Grinding Fluids.** R. Furuichi and Y. Tanaka. *Japan Society of Mechanical Engineers, Transactions,* v. 142, no. 24, 1958, p. 340-345.

Various emulsion-type grinding fluids based on spindle oil studied under various grinding ratios, tangential grinding force, the wearing state of the grinding wheel and the rate of dilution of the grinding fluid. Vacuum annealed spring steel

is used as a test sample. Additives to the fluid are rape-seed oil, paraffin chloride and tri-cresyl phosphate. With the increase of the rate of dilution of the fluid, the grinding ratio decreases and the tangential grinding force and the wearing rate of the grinding wheel increase. (G18; NM-h)

554-G. **Carbide Versus Carbide.** Robert T. Hook. *Automatic Machining,* v. 19, Oct. 1958, p. 45, 46.

After a seven-year study, a company is using premium grade carbide in turret lathes, thus increasing their speed of production with no increase in wear, resulting in a $68,000 saving. (G17a; 6-69)

555-G. **Oxides at Oldsmobile.** *Automatic Machining,* v. 19, Oct. 1958, p. 51-53.

Two production machining operations employing oxide tools are finish turning brake drums and semi-finish turning camshaft bearings. Advantages of using oxide tools and operating data. (G19q; 6-70)

556-G. **High-Speed Piercing Method Slashes Short-Run Costs.** E. J. Egan, Jr. *Iron Age,* v. 182, Oct. 23, 1958, p. 73-75.

New 20-turret punch press, which is fast, flexible and safe, speeded up production of vending machine parts. (G2j, W24p)

557-G. **Machining the "Supermetals".** *Mill and Factory,* v. 63, Sept. 1958, p. 115.

Higher speeds and throw-away cutters have reduced time and tool breakage in machining "superalloy" steels and greatly improved the quality of aircraft and missile parts. (G17, W25r; SS)

558-G. **Effects of Operating Variables on Abrasive Belt Life.** J. M. Pitblado. *Tool Engineer,* v. 41, Oct. 1958, p. 113-116.

(G18, W25c)

559-G.* (German.) **Electric-Discharge Machining of Tools.** Hans Joachim Schulz. *Giesserei,* v. 45, Sept. 25, 1958, p. 615-623.

Describes set-ups for producing spark energy and for adjusting distance between work and tool electrode; method of operation of modern electric-discharge machine tools. Method for determining shape of tool electrodes; methods for manufacture of spark-machining tools and the electric-discharge engraving of a die. Examples of operation of process; economy of the process. 12 ref. (G24a; TS)

560-G.* **Natural Gas for Cheaper Cutting.** William J. Semple. *American Machinist,* v. 102, Aug. 25, 1958, p. 69-71.

Purpose of the tests was to ascertain which type and make of equipment, operating on either natural gas or acetylene, would give the lowest total cost for oxygen cutting while maintaining satisfactory quality. Test setup and procedure; results with the aid of graphs. (G22g; RM-m35)

561-G.* **Types and Properties of Cutting Fluids. Pt. 1.** E. L. H. Bastion. *Canadian Metalworking,* v. 21, Oct. 1958, p. 16, 18, 20, 22, 24, 26.

Historical outline; performance and service properties. Where cooling is the most important requirement, the emulsion or water-based solution is best. High-carbon and hard alloy steels are best machined with chemically active oils containing sulphurized fatty oils. For machining tough, "stringy", low-carbon steel, straight, sulphurized mineral oils are used. In machining tough, ferrous alloys chlorinated or sulphochlorinated oils perform well. (To be continued.) (G17; NM-h)

562-G.* **How Roll Flowing Works. Pt. 2.** Richard E. Paret. *Metal Forming and Fabricating,* v. 20, Oct. 1958, p. 27-28.

Roll flowing produces parts to a predetermined shape by the cold flowing of metal over a mandrel. Blank development and proper balancing of roller pressure and feed are the most important factors. (G13)

563-G.* **Ceramics Prove Themselves on Copy Turning.** *Metalworking Production,* v. 102, Oct. 17, 1958, p. 1820-1821.

A standard copying lathe with a larger motor provides faster cutting speeds and longer tool life with the use of ceramic tools. Properties of ceramic material compared with those of carbide. Ceramic tip holders. (G17a; T6n, 6-70)

564-G.* **Grinding Space Age Materials.** John A. Mueller. *Tool Engineer,* v. 41, Nov. 1958, p. 127-128.

Grinding specifications for silicon carbide, alumina, Zr and Mo. (G19; Si, 6-69, Al, 6-70, Zr, Mo)

565-G.* (German.) **Progress in Machine Finishing, Finishing Lathes and Finishing Drills.** Hermann Schopke. *Industrieblatt,* v. 58, Aug. 1958, p. 333-338.

Procedures and machinery used for surface finish of cylindrical bodies, both inside and outside. Definition of terms; construction and function of horizontal and vertical inside-finishing lathes, horizontal and vertical outside-finishing lathes, multiple spindle machines; profile drill; spindle units, special machines, transfer routes. Fine machining of outer surfaces by ordinary production machinery. (G17a, W25)

566-G.* (German.) **Lapping in Modern Finishing.** Wilhelm Schmid. *Industrieblatt,* v. 58, Aug. 1958, p. 338-341.

Lapping, developed originally to remove very thin surface layers in finishing operations, has gained new importance for other procedures; by careful selection of abrasive grains and proper combination of lapping compounds, it is now possible to remove considerable amounts. Thus, lapping can replace other procedures like grinding, in some cases even milling. The advantage of lapping is better surface quality at the end of operations. Lapping methods, available machinery and most important lapping compounds discussed. Reference is made to the recently developed "beam-lapping". (G19p)

567-G.* (German.) **Drilling With Hard Metal Tools.** Hermann Hardt. *Industrieblatt,* v. 58, Oct. 1958, p. 419-424.

Use of hard-metal tools is no longer restricted to turning, planing and milling, but includes other procedures like drilling and boring. "Spiral drill" as well as a number of drills for special application. Influence of material to be drilled, characteristics of drills, length of time before resharpening, chip removal, accuracy obtained, energy consumption, working speeds, lubrication. Problems encountered in drilling. Suggestions on use of hard-metal cutting tools to best advantage. (G17e, T6n; SGB-q)

568-G.* (German.) **Protruding With Punch (Sheet Metal Work).** R. Wilken. *Werkstatttechnik und Maschinenbau,* v. 48, Aug. 1958, p. 413-420.

Flow of material, effective stresses, most suitable shape of punch, forces necessary for various tools and materials. Size and shape of protruded portion. (G2j)

569-G.* (Italian.) **Factors That Influence Surface Finishes.** Carlo Rosini. *Rivista di Meccanica,* v. 9, June 21, 1958, p. 19-26.

Factors in production of acceptable surface finishes include type of machining operation and machine tool used, tool characteristics, feed, depth of cut, speed, lubricant, characteristics of workpiece. (G17)

570-G.* (Italian.) **Plastic Working of Sheet Steel. Pt. 2. Bending.** Riccardo Levi. *Rivista di Meccanica,* v. 9, July 19, 1958, p. 19-24.

Calculation of development of bends; lengthening and loss of thickness of bent fibers; displacement of undeformed fiber (neutral axis) from centerline of material thickness toward center of curvature; other phenomena associated with bending; bending tests. (G6; ST, 4-53)

571-G.* **Forming Metals at High Velocities.** T. C. DuMond. *Metal Progress,* v. 74, Nov. 1958, p. 68-76.

Capabilities, limitations, 11 different methods of explosive forming. Types of metals to which applied. (G-general; NM-k34)

572-G. **Tooling and Technique Build 880 Jets.** George H. DeGroat. *American Machinist,* v. 102, Aug. 25, 1958, p. 84-87.

An outstanding technique for assembly, which combines adhesive bonding and riveting, was developed to make the wings leakproof and to increase strength and resistance to fatigue. (G17, T24a; Al-b)

573-G. **Chrysler Machines With Job-Tested Oxides.** Ben C. Brosheer. *American Machinist,* v. 102, Nov. 3, 1958, p. 108-113.

Cutting speeds, tool life and quality control were improved compared with carbide bits. (G17, T6w; SGA-j)

574-G. **Ceramics for Machine Tools. Pt. 2.** R. M. Gill and G. Spence. *Ceramics,* v. 9, Sept. 1958, p. 27-31.

Applications, advantages and limitations of modern oxide ceramic tooling in relation to mild steel, cast

iron, gear steel and toolsteel.
(G17, T6n; 6-70, CI, CN, TS)

575-G. Description of Electrolytic Jet Etching of Silicon. Albert Mark. *Electrochemical Society,* Abstract no. 72, May 1957, p. 165-169.

Holes are drilled into Si crystals by high-pressure liquid stream in lieu of a conventional metal drill. (G24b; Si)

576-G. Tool Steel Failures. G. Davitz. *Engineer and Foundryman,* v. 24, Aug. 1958, p. 63-70.

Causes of tool failure which can be avoided by proper choice of steel, correct heat treatment, good design, proper grinding.
(G17, S21; TS, 17-57)

577-G. Cold-Working Relieves Weld Stress, Eliminates Metal Removal. H. L. Meredith. *Industry and Welding,* v. 31, Oct. 1958, p. 76-77, 86.

(G23, F29a; Al-b, 7-51, 3-66, 4-60, 3-74)

578-G. Hot-Cup Cold-Draw Process Forms to Tight Dimensions. R. O. Schulin. *Iron Age,* v. 182, Nov. 6, 1958, p. 110-112.

Artillery shells formed in two-step operation to closer tolerances, better surface finish. Labor, material costs cut. (G4, F22, T2j)

579-G. (Italian.) **Plastic Working of Sheet Steel. Pt. 2. Bending.** Riccardo Levi. *Rivista di Meccanica,* v. 9, July 5, 1958, p. 27-33.

Machines and accessories used for bending operations; feeding attachments; safety measures. (To be continued.)
(G6, W24, A7p; ST, 4-53)

580-G. Special Techniques Help Lick Complex Stainless Shapes. R. H. Eshelman. *Iron Age, v.* 182, Nov. 13, 1958, p. 135-137.

Suggestions for special handling, machining, inspecting of difficult shapes made of high-strength material. (G17; SS)

(G10p, T7f; Cu-f, Cu-n)

597-G. (German.) **Finish Machining—Present, Future.** Hans H. Finkelnburg. *Industrieblatt,* v. 58, Aug. 1958, p. 319-327.

Definition of terms (honing, beam-lapping, electro-erosion); operations, applications; recently developed machinery. 10 ref.
(G19, G24)

598-G. (German.) **Economical Use of Grinding Machinery in Continuous Production.** W. Peter. *Industrieblatt,* v. 58, Aug. 1958, p. 327-332.

Two basic methods of cylindrical grinding, and three other methods derived from the two. Applications in different fields, taking continuous production into consideration. Requirements in dimensional accuracy and surface quality. (G18g)

599-G. (German.) **Effects of Grease in Belt Grinding. Pt. 2.** G. Pahlitzsch and M. Magnussen. *Metalloberfläche,* v. 12, Oct. 1958, p. 308-312.

(G18; NM-h)

600-G. (German.) **Thread Grinding.** F. Zimmermann. *Werkstatt und Betrieb,* v. 91, Sept. 1958, p. 551-556.

(G18k, T7f)

601-G. Free Machining Annealed Grey Iron. A. Whitmore. *British Foundryman,* v. 51, Aug. 1958, p. 385-387.

Excellent free machining qualities are obtained by annealing gray cast irons of a high carbon equivalent value, as the resulting material has a mainly ferritic matrix. Annealing cycles and effect of heat treatment on metallographic structure.
(G17k, J23, 2-64; CI-n)

602-G. New Drawing Process Eliminates Heat Treating for Strong Parts. E. S. Nachtman and E. B. Moore. *Journal of Metals,* v. 10, Apr. 1958, p. 281-284.

Heat treating with attendant processing steps (straightening, descaling, etc.) eliminated in the production of many parts by introduction of a medium-carbon steel bar (C-1144) produced by elevated-temperature drawing. 4 ref.
(G4, Q-general, 2-62, 3-68; ST, 4-55)

603-G. Boron Steel for Deep Drawing. L. R. Shoenberger. *Metallurgical Society of AIME, Transactions,* v. 212, June 1958, p. 402-405.

Hot tearing and boron analysis procedures overcome. Boron semi-killed steel reveals structures and mechanical properties not found in low-carbon steels. 8 ref.
(G4b, Q-general; ST-k, *B, Al*)

604-G. Automatic Line Tracing in Oxygen Shape-Cutting Machines. A. F. Chouinard and E. L. McDonald. *Welding Journal,* v. 37, Oct. 1958, p. 988-990.

Motion of torches is controlled automatically by electronic line tracer following lines of ordinary pattern drawings rather than black-white edges on specially prepared edge patterns or templets. (G22g)

SECTION H

POWDER METALLURGY

1-H. Evaluation of Titanium Powder for Metallurgical Use. Craig T. Waldo. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-CTW-1, Apr. 25, 1956, 15 p. (CMA)

Titanium powders from six sources were cold pressed, sintered, hot rolled, pickled and machined. Test data were obtained for hardness, bending, tensile strength and microstructure. Vacuum system used in the study. (H12; Ti)

2-H. Powder Metallurgy as an Aid to Production Engineering. G. R. Bell and L. M. Maricchi. *Engineer and Foundryman,* v. 22, Aug. 1957, p. 54-60.

Applications and production presses. (H general, 1-72)

3-H. (German.) **History of Metal Powders.** F. M. Feldhaus. *Planseeberichte für Pulvermetallurgie,* v. 5, Aug. 1957, p. 54-55.

9 ref. (H general, A2)

4-H.* Preparation of Uranium and Uranium Alloy Powder Metal Compacts. Herbert S. Kalish. *American Society for Metals, Transactions,* v. 51, Preprint no. 63, 1957, 22 p.

Uranium parts have been made by cold pressing and sintering, hot pressing and powder rolling. Hot pressing appears to be the most favorable for unalloyed uranium, yielding fine grain size, random orientation uranium parts, and is amenable to the fabrication of slugs and hollow cylinders. Cold pressing and sintering appear most promising for making uranium alloy parts. (H14, H15; U)

5-H.* Sweden: Iron Powder to Rolled Steel in One Operation. Bo Kalling, Sven Eketorp and Sven Backstrom. *Journal of Metals,* v. 9, Nov. 1957, p. 1440-1444. (From *Jernkontorets Annaler,* v. 141, no. 6, 1957, p. 317-330.)

The Stora powder steel process developed by Stora Kopparbergs Bergslags A/B, Sweden. Granulated pig iron is decarburized with iron oxide, and the low-carbon product is rolled directly to compact steel. 11 ref. (H10c, H14j; Fe, ST)

6-H.* Vacuum Sintering. Pt. 2. Henry H. Hausner. *Precision Metal Molding,* v. 15, Nov. 1957, p. 91-92, 94-95.

Effects of sintering atmosphere on porosity and pore migration in Cu powders. Experiments show that vacuum sintering not only affects the density and total porosity but especially the distribution of pores of various sizes throughout the sintered compact. Pore-size distribution determines the grain structure. (To be continued.) (H15, 1-73, H11; Cu, 6-70)

7-H.* Introducing Commercial Titanium Powder. Alfred R. Globus. *Precision Metal Molding,* v. 15, Dec. 1957, p. 38-39, 79.

New UniFide Ti powder of United International Research Inc. is stable and shows no tendency to spontaneous combustion. Unlike powder made from Ti sponge this powder consists of tiny individual particles offering excellent compressibility. 4 ref. (H10; Ti)

8-H.* Vacuum Sintering. Pt. 3. Henry H. Hausner. *Precision Metal Molding,* v. 15, Dec. 1957, p. 44-46, 69.

Comparison of A-sintered and vacuum sintered Be campacts. Effect of sintering temperature on density and electrical resistivity; effect of compacting pressure on the pressed density of compacted Zr and Zr

hydride powders. 16 ref.
(H15, 1-73, H12; Be, Zr)

9-H. Titanium Carbide. J. C. Redmond. *Product Engineering,* v. 28, Nov. 11, 1957, p. 84-86. (CMA)

Powder metallurgy techniques. (H general, P general, Q general; Ti, 6-69)

10-H. How to Give Powdered Metals Strength. *Steel,* v. 141, Nov. 25, 1957, p. 110-111, 114.

By filling pores with another metal, notch effects are eliminated. Physical properties controlled by varying conditions and materials. (H16e; ST, Cu)

11-H.* Cermets: Pt. II. Wettability and Microstructure Studies in Liquid-Phase Sintering. N. M. Parikh and M. Humenik, Jr. *American Ceramic Society, Journal,* v. 40, Sept. 1, 1957, p. 315-320.

The microstructures of polyphase, heterogeneous systems, sintered in the presence of a liquid phase, are analyzed on basis of wettability and surface-energy relations. General principles relating to primary factors affecting microstructure. Application of these principles to such diverse systems as metal-carbide, metal-glass, metal-metal show that the microstructure and distribution of the solid in liquid is primarily determined by various surface-energy relationships. A general "coalescence hypothesis" based on this work is proposed. 7 ref.
(H15, P13h, M27; 6-70)

12-H.* Activated Sintering. M. Eudier. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 5-9.

Activated sintering involves the use of a highly reactive vapor to accelerate the complete sintering of the metal particles. This process is useful not only for increasing the physical properties of sintered metal but also for accelerating the formation of homogeneous alloys from mixed powders during the sintering operation. 6 ref. (H15n)

13-H.* Production and Characteristics of Chemically Precipitated Nickel Powder. K. O. Cockburn, R. J. Loree and J. B. Haworth. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 10-24.

Processes at Sherritt Gordon Mines Ltd., Fort Saskatchewan, for leaching, Cu removal, Ni reduction. Nickel powder handling, characteristics of Sherritt Ni powder, properties and place of Ni in powder metallurgy. 11 ref. (H10, H11; Ni)

14-H.* Production and Characteristics of Chemically Precipitated Copper Powder. Vanston H. Ryan and Henry J. Tschirner. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 25-32.

Leaching, purification, reduction and powder washing, drying and crushing, types of powder produced, physical tests on Cu powders and an analysis of the physical properties of Cu powders produced at Whitaker Metals Corp., Kansas City, Mo. (H10, H11; Cu)

15-H.* Current Developments in the Rolling of Both Ferrous and Nonferrous Powders. John D. Shaw and Walter V. Knopp. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 33-41.

Production of continuous strip from metal powders. Thickness of strip; green density of strip; sintering of green compacted strip; comparison of hot and cold rolling; effect of variables and powder rolling; properties of typical powders used in rolled strip. 5 ref. (H14j, H11)

16-H.* Fiber Metallurgy. Cord H. Sump and William Pollack. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 42-48.

Manufacture of fiber metal in sheet form. Felting and matting of metal fibers; optimum sintering temperature; tensile strength and mechanical properties of stainless steel wool. (H17; SS, 4-62)

17-H.* Superfine Iron Powders. Michael W. Freeman and John H. L. Watson. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 112-124.

Electron microscopic studies of crystal structure to determine the nature of submicron particles. 9 ref. (H11g, T11h, M26; Fe)

18-H.* Sintering of Iron-Copper-Carbon Compacts. P. Ulf Gummeson and Lennart Forss. *Metal Powder Association, Proceedings, 13th Annual Meeting,* v. 1, 1957, p. 131-137.

Factors affecting results; effect of additions on dimensional changes, hardness, rupture strength. (H15, Q general; Fe, Cu, C)

19-H. Compacting and Sintering Characteristics of Horizons Inc., and Carborundum Co. Zirconium, and

Electro Metallurgical Titanium Powders. J. R. Pekoke. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-JRP-1, May 11, 1956, 9 p. (CMA)

(H11n, H15; Ti, Zr)

20-H. Manufacture of Hafnium Metal Powder by the Hydride Process. R. N. Honeyman. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-RNH-2, Sept. 5, 1956, 4 p. (CMA)

(H10c; Hf)

21-H. Proposed System for the Manufacture of Hafnium Metal Powder by the Hydride Process. R. N. Honeyman and G. R. Kingsbury. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-RNH-3, Sept. 13, 1956, 8 p. (CMA)

(H10c; Hf)

22-H. (German.) **Physics, Processing and Testing of Powder Metal Parts.** Helmut Gsken. *Industrie Anzeiger,* v. 79, Aug. 20, 1957, p. 1003-1004.

23-H.* Future Potentials for Powder Metallurgy of Titanium. Arthur D. Schwope. *Metal Progress,* v. 72, Dec. 1957, p. 156, 160-161. (Digest from "Present Limitations and Future Potentials of Powder Metallurgy", ASM Titanium Conference, Los Angeles, Mar. 25-29, 1957.)

The products of both the Na and Mg reduction of Ti tetrachloride have yielded fines which are relatively pure. Implications of a fine, pure powder are that the more normal powder processing techniques can be used and that thinner cross sections can be obtained in the pressed article. (H general; Ti)

24-H. (Russian.) **Analogy Between Sintered and Hot Pressed Metallo-Ceramic Materials.** M. K. Ribalchenko. *Metallovedenie i Obrabotka Metallov,* no. 7, July 1957, p. 24-27.

Both materials were tested for physical properties and yielded similar results. (H14h, H15)

25-H.* Powder Metallurgy. Technique and Applications. *Metallurgia,* v. 56, Dec. 1957, p. 271-275.

Production and testing of metal powders and the manufacture of articles from them by compaction and sintering. Included in the applications mentioned are a number of engineering components which could not be made by conventional metallurgical techniques. (H general)

26-H. Bigger Powdered Bearings. *Steel,* v. 141, Dec. 23, 1957, p. 72.

Problem of making outsized, self-lubricating bearings solved by joining sections of powdered metal with Ag solder. (H16, K7, T7d; Ag)

27-H. Dispersed Hard Particle Strengthening of Metals. N. J. Grant and O. Preston. Massachusetts Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131221, Nov. 1956, 34 p. $1.

Theoretical aspects of hardening and strengthening; problems encountered in powder metallurgy of the various processes. (H11; Cu, Al, Ni, Be)

28-H. Reduction Structures of Iron Powders. J. O. Edstrom. *Jernkontorets Annaler,* v. 140, no. 2, 1956, p. 116-129. (Henry Brutcher Translation no. 3886, Altadena, Calif.)

Previously abstracted from original. See item 79-H, 1956. (H10, H11, Fe)

29-H.* (German.) **Oxidation of Pyrophoric Iron Surfaces.** Friedrich Erdmann-Jesnitzer and Gunter Wieghardt. *Werkstoffe und Korrosion,* v. 8, Nov. 1957, p. 669-673.

Storage of powdered pyrophoric iron under commercial nitrogen does not decrease tendency to oxidize. Decrease of pyrophoric characteristic is due to traces of oxygen present in the nitrogen which causes formation of an oxide layer. 8 ref. (H11q; Fe)

30-H.* (Italian.) **Some Fundamental Aspects of Powder Metallurgy.** Giovanni Baralis. *Ingegneria Meccanica,* v. 6, Oct. 1957, p. 25-33.

Review of principal methods of producing metal powders and their most important applications; factors influencing properties of powders and quality of objects made from them; perspectives for powder metallurgy. (H general)

31-H.* (Italian.) **Powder Metallurgy. Pt. 1. What Powder Metallurgy Is.** Neri Corsini. *Rivista di Meccanica,* no. 171, Oct. 12, 1957, p. 7-12.

Origin and development of powder metallurgy; applications in production of structural machine parts. (To be continued.) (H general)

32-H. High Density Boosts Strength. *Chemical and Engineering News,* v. 36, Jan. 13, 1958, p. 45-46.

New process uses special powders to make iron and steel powder parts with higher density. (H general; Fe)

33-H.* (Italian.) **Manufacture of Hard Metal Under Absolute Vacuum.** *Macchine,* v. 12, Oct. 1957, p. 1027-1037.

Process used by Continental Tool Co., Arnhem, Germany, for production of its new product "Sintronic". (H general, 1-73; EG-d)

34-H. (Russian.) **Pressing and Sintering of Cermet Compositons Containing Copper.** T. N. Znatokova and V. I. Likhtman. *Fizika Metallov i Metallovedenie,* v. 4, no. 3, 1957, p. 511-518.

Process of pressing and sintering of copper-graphite, copper-tin and copper-tin-graphite compositions. 11 ref. (H14, H15; Cu, Sn, 6-70)

35-H. (Book.)**Metal Powder Association, Proceedings, 13th Annual Meeting,** v. 1, 1957, 147 p. Metal Powder Association, 130 W. 42nd St., New York 36, N. Y.

Collection of 16 papers read at Chicago, Apr. 30 to May 1, 1957 covering theory, practice and applications. Each paper abstracted separately. (H general)

36-H. High Heat Resisting Aluminum. R. Irmann. *Canadian Metalworking,* v. 20, Dec. 1957, p. 38-39.

Properties and other qualities of sintered Al powdered metal. (H general, Q general; Al, SGA-h)

37-H. Magnetic Tape Rolled From Powdered Metals. C. E. Richards. *Electrical Manufacturing,* v. 60, Dec. 1957, p. 104-109.

Production of magnetic alloy strip by sintering mixed powders and cold rolling the billets. 7 ref. (H14j; SGA-n)

38-H.* Copper-Silica and Copper-Alumina Alloys of High-Temperature Interest. Klaus M. Zwilsky and Nicholas J. Grant. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1197-1201.

Alloys containing up to 10 Vol. % of oxide were made by utilizing relatively coarse Cu powders and several sizes of silica and alumina powders. The alloys were prepared by mechanical mixing of powders followed by cold hydrostatic pressing, sintering and hot extrusion. (H general; Cu, *Al, Si,* SGA-h)

39-H. Report on Powder Metallurgy in the U. S. S. R. Henry H. Hausner. *Metal Progress,* v. 73, Jan. 1958, p. 105-108, 196.

"Self criticism", Russian style, of the knowledge and practice of powder metallurgy as of 1953, calls attention to deficiencies in meeting the aims of the last five-year plan. Indications in subsequent literature show that many of these deficiencies are being rapidly corrected. (H general)

40-H.* Making Strip Metal From Metallic Powder. William N. Hayden, John D. Shaw and Walter V. Knopp. *Precision Metal Molding,* v. 16, Jan. 1958, p. 48.

Powder is fed to a rolling mill where it is compacted to less than full density, but into strip strong enough to be handled. From the mill, it may be rolled into coils for batch annealing, or may be fed directly onto the belt of a continuous sintering furnace. The operations which follow sintering, such as annealing, and cold or hot re-rolling, etc., adhere to standard practices. (H14j, H15)

41-H. How to Give Powdered Metals Strength. *Steel,* v. 141, Nov. 25, 1957, p. 110-114.

Iron or steel powdered compacts are infiltrated with melted copper. Data on heat treatment and physical properties. (H16e; Fe, ST, *Cu*)

42-H. (German.) **Production of Large Hard Metal Rings and Other Products by Sintering.** E. Bryjak and W. Missol. *Fertigungstechnik,* v. 7, Dec. 1957, p. 557-561.

Values for the density and the hardness comply with data in literature. (H14, Q29n, P10a)

68-H.* (German.) Connecting Aluminum to Copper by Liquid Phase Sintering of Al-Cu Powder. F. Erdmann-Jesnitzer and A. Arnold. *Metall,* v. 12, Mar. 1958, p. 179-185.

Experiments to determine the influence of various factors on durability. Most favorable results obtained at 600 C. with sinter pressure of 0.25-0.50 kg. per sq. mm. and sintering duration of 6 min. Influence of surface property, particle size and flux evaluated. 12 ref. (H15, H16e; Al, Cu)

69-H. (German.) Sintered Parts. G. Zapf. *Technische Mitteilungen,* v. 50, Jan. 1957, p. 38-41.

(H15)

70-H. Porous and Infiltrated Metal. Pt. 1. Powder Metallurgy Applications, Bearings, Fundamentals of the Process. Pt. 2. Iron-Copper Materials, Sintered Iron Bearings, Sintered Components. J. E. Elliott.

Metal Industry, v. 92, Apr. 11, 1958, p. 293-296; v. 92, Apr. 18, 1958, p. 307-309.

(H-general, H16e, T7d; 17-57, Fe, Cu)

71-H.* Consolidation of Molybdenum by Powder Metallurgy Practice. Howard Scott, W. A. Taebel and D. D. Lawthers. Paper from "The Metal Molybdenum", American Society for Metals, p. 51-79.

Molybdenum powder is quite vulnerable to contamination by air. The contaminants, chiefly oxygen and water vapor, have detrimental effects on the mechanical properties of the consolidated metal. Oxidation characteristics of Mo were studied to determine the conditions for pressing and sintering with minimum contamination. 7 ref. (H14, H15; Mo)

72-H.* Powder Metallurgy Molybdenum-Base Alloys. Robert I. Jaffee. Paper from "The Metal Molybdenum", American Society for Metals, p. 330-364.

Major difference between Mo-base alloys prepared by powder metallurgy and those produced by arc-casting is the superior hot breakdown fabrication characteristics of the powder metallurgy product. This is due to the finer initial grain size of the as-sintered alloy. Impurities are distributed over a much larger grain boundary area. Therefore, powder metallurgy alloys may be forged or rolled directly from the as-sintered condition and do not require the initial extrusion operation necessary for arc-cast material. 4 ref. (H-general, F22, F23; Mo)

73-H. Pressure Correlations in the Production of Hard-Metal Powder Compacts. A. G. Samoilov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* no. 2, Feb. 1957, p. 159-162. (Henry Brutcher, Altadena, Calif., Translation no. 4071.)

Previously abstracted from original. See item 83-H, 1957. (H14; W, 6-89)

74-H.* (German.) Compound Materials (Cermets) Made of Aluminum Oxide and Iron or Iron Alloys. Werner Jellinghaus and Toshimori Shuin. *Stahl und Eisen,* v. 78, Apr. 3, 1958, p. 419-429.

Fine-grained powder mixtures; pressing, sintering; density, structure, tensile, creep and impact strength; permeability of materials poor in oxides. Properties of oxide-rich materials; scaling resistance, electrical resistance. Effect of Ni, Cr and Mo additions on strength at elevated temperatures of Fe-Al oxide materials. 16 ref. (H-general; Al, Fe, 6-70)

75-H.* (German.) Relation Between Particle Size, Depth of the Magnetically Heterogenous Surface Layer, Coercive Force and Saturation Magnetization of Carbonyl Iron and Magnetite Powders. Karl Torkar, Othmar Scheikl and Heinrich Egghart. *Archiv für das Eisenhüttenwesen,* v. 29 , Feb. 1958, p. 139-146.

Carbonyl iron powder of 0.0117 and 0.1-micron particle size and magnetite powder between 1 and 827-micron particle size were investigated as to coercive force and saturation magnetization. The maximum coercive force was found to be 160 for carbonyl iron and 110 Oe. for magnetite, originating from crystal anisotropic properties. These maxima were found to exist at particle sizes of 0.01 micron for carbonyl iron and at 1 micron for magnetite. 19 ref. (H11h, H11p; Fe)

76-H.* Gas Desorption of Copper Powders. J. C. Tobin and M. J. Sinnott. *AIME Transactions,* v. 212, Apr. 1958, p. 167-171.

Technique for collecting and analyzing the small quantities of gases desorbed on heating metal powders. Gases collected from Cu powders of various types of manufacture contain H_2O, CO_2, and SO_2. Source of the gas traced to surface films on the powder. 8 ref. (H11q; Cu)

77-H. Use of Nickel-Silver Powder Increasing in Low-Cost, High-Production Powder Metallurgy Industry. *Inco,* v. 27, Apr. 1958, p. 21-23.

Pressed metal parts offer cost savings, high production rates, accuracy and varied applications. (H-general, 17-57; Ag, Ni)

78-H.* Porous and Infiltrated Metal. J. E. Elliott. *Metal Industry,* v. 92, Apr. 25, 1958, p. 334-336.

Porous iron infiltrated with molten Cu increases tensile strength and elongation substantially. Sintered bronze filters, composed of spherical powder particles can be made with a wide range of filtering performance. (H16e; Fe, Cu)

79-H.* Atomized Powder Alloys of Aluminum. R. J. Towner. *Metal Progress,* v. 73, May 1958, p. 70-76, 176.

When molten Al alloys, for example 8% iron, are atomized, the fine powder can be compacted and

extruded into metal parts with superior strength and structure stability at 400 to 800° F.
(H10f, Q-general, 2-62; Al)

80-H.* Fiber Metallurgy. R. H. Read, W. Pollack and S. W. McGee. *Precision Metal Molding,* v. 16, Apr. 1958, p. 25-26, 53, 58.

Fiber sources, metal fiber felting, pressing, sintering, rolling, press forming, machining and impregnating processes in production of fiber metal parts. Applications of fiber metal. (H17)

81-H. 7th Annual Powder Metallurgy Directory. Advances in Powder Metallurgy. *Precision Metal Molding,* v. 16, Apr. 1958, p. 67-68, 91.

Suppliers of equipment and materials for the industry comment on developments in powder metallurgy. (H-general)

82-H. (English.) **A Study of CrB Cermet.** Riitsu Takagi, Kiyoshi Tamura and Yoshio Tamura. *Journal of Mechanical Laboratory of Japan,* v. 3, 1957, p. 96-98. (From *Journal of Mechanical Laboratory,* v. 11, p. 140.)

Experimental vacuum, hot pressing of chromium-boron powder with or without 10% Ni. Chromium boron pressed at 700° C. obtained densities of 99.5% of theoretical value. Oxidation resistance and thermal shock resistance of cermet. (H14h, 1-73; Cr, B, 6-70)

(H14g, H11k)

89-H.* Sintered Metal and Cermet Friction Materials. *Metallurgia,* v. 57, May 1958, p. 247-250.

Sintered metal linings are produced by the compression and partial fusion of very fine particles, mainly of powdered metals. Their physical properties, derived from their constituent metals, give them, under certain conditions of high unit loading, longer life and more stable friction than asbestos-based materials. (H14, H15, Q9p)

90-H.* (German.) Synthetic Solid Bodies. Pt. 2. Influence of Surface Layers Such as Oxide Films on Sintering of Metals. Martin Clasing. *Zeitschrift für Metallkunde,* v. 49, Feb. 1958, p. 69-75.

Tensile strength, fracture, strain, hardness and density of sintered Cu powders were observed under varying conditions as to degree of preoxidation, grain size, sintering temperatures and sintering time under vacuum. Strength of the sintered material was improved through thin oxide films. The oxygen of the film is dissolved in the early stage of the process thus leaving a highly active surface structure which in turn enhances the welding action among particles. 8 ref.
(H15, Q-general; Cu, 6-72)

91-H. (English.) **Sintering of Multi-Phase Bodies. Pt. 3. Sintering of Mixtures Containing Low-Melting-Point Powders.** B. Ia. Pines, A. F. Sirenko and N. I. Sukhinin. *Soviet Physics, Technical Physics,* v. 2, 1958, p. 1763-1772. (Translation by American Institute of Physics.)

Contraction of samples of single-component powders (copper) depends to a great extent on the initial porosity and the compression

pressure (presence of closed pores filled with gas). As the compression pressure increases the amount of contraction first decreases but later the curve changes sign (i.e., contraction is replaced by "growth" and increase of the dimension of the samples after sintering takes place). "Growth" occurs whenever the pressure of the gas in the closed pores in the heated samples exceeds the "negative" capillary pressure acting at the surface of the pores. 5 ref. (H15; Cu)

92-H.* (French.) **Study of Metallic Cobalt Powders Obtained by Pyrolysis From Normal Alcanoates.** Claude Moreau and Georges Rodier. *Comptes Rendus,* v. 246, Mar. 24, 1958, p. 1861-1864.

Preparation of metallic Co of variable texture by thermal decomposition in controlled atmosphere of anhydrous salts of fatty acids of the $(RCOO)_2Co$ type; measurement of specific surface of powders, radiocrystallographic study and electron microscope examination. 6 ref. (H10c; Co)

93-H.* (German.) **State of Development of Technique for Producing Sintered Parts of Complicated Shape.** H. Silbereisen. *Fertigungstechnik,* v. 8, Apr. 1958, p. 163-169.

Increased production of sintered parts through application to more complicated shapes could be obtained through improvements in materials and techniques employed in the sintering process. Methods for obtaining these improvements and prospects for new fields of application. (H-general)

94-H. Powder Metallurgy Scores Impressive Gains. Andrew W. Shearer. *Automotive Industries,* v. 118, Apr. 15, 1958, p. 54-56, 116-118, 120.

Applications in the automobile industry. (H-general, T21, 17-57)

95-H. (English.) **Preparation of High Purity U^{233} and U^{235} Powders.** *Soviet Journal of Atomic Energy,* v. 3, no. 9, 1957, p. 1072-1073. (Translation by Consultants Bureau, Inc.)

Powders of these isotopes are obtained by reducing uranium dioxide by means of calcium in a reaction vessel. Metallic powder yield is 97-98% from the dioxide. Yield obtained by hot pressing of parts consisting of these powders is greater than 99%. (H10c, H14h; U, 14-63)

96-H. Direct Rolling of Steel Sheets From Granulated Pig-Iron. B. Kalling, S. Eketorp and S. Backstrom. *Iron and Coal Trades Review,* v. 176, Feb. 28, 1958, p. 495-500. (From *Jernkontorets Annaler,* v. 141, no. 6, 1957, p. 317-331.)

Previously abstracted from original. See item 73-H, 1957. (H14j; Fe, ST)

97-H. Sintered Aluminium S. A. P. F. Bollenrath. *North Atlantic Treaty Organization, Advisory Group for Aeronautical Research and Development,* Report no. 103, Apr. 1957, 18 p.

Methods used by the Aluminium-Industrie A. G., Neuhausen, allow the fabrication of sintered bodies from pure Al powder containing limited percentages of aluminum oxides. 7 ref. (H-general; Al)

98-H.* Compacting of Powders Using Molds Made From Reversible Gels. T. W. Penrice. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 1-6.

Plasticized polyvinylchloride in gel form is placed around the die pattern. The gel is sufficiently rigid to maintain its shape when the pattern is removed and powder placed in the cavity, but acts like a liquid under pressure, transmitting pressure equally over the powder, resulting in high densities and dimensional control. (H14g)

99-H.* The Continuous Production of Strip by the Direct Rolling Process. D. K. Worn. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 7-13.

Direct rolling process for metal powders is currently uneconomical to compete with conventional methods for common alloys, but useful in specialized applications, involving nuclear components, or alloys too brittle for ordinary rolling. 17 ref. (H14j; 4-53)

100-H.* Consolidation of Metal Powders by Hot Working Within Sheaths. J. Williams. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 14-23.

Hot consolidation of metal powders within metal sheaths makes available a number of methods for the production of a wider variety of shapes and sizes than is possible with the normal powder metallurgi-

cal techniques. Chemically reactive metal powders can be densified without the need for special atmospheres. (H14h, F21g)

101-H.* Developments in Vacuum Sintering Furnaces. M. Donovan. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 24-32.

Vacuum equipment, heating system, and thermal insulators; induction, radiation and direct heating, use of radiation screens and other techniques. (H15q, 1-73, 1-52)

102-H.* Conditions for Effective Vacuum Sintering and Their Realization in Practice. Ctto Winkler. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 33-40.

Two types of adsorption, the desorption process, evaporation, and vacuum sintering practice. (H15q, 1-73)

103-H.* The Pressureless Sintering of Loose Beryllium Powder. T. R. Barrett, G. C. Ellis and R. A. Knight. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 41-49.

New technique established on a production basis allows consolidation of loose Be powder to high densities without application of pressure. Possibility of direct fuel-element production by sintering the powder around an uranium ceramic core. (H15n; T11g; Be)

104-H.* Zone Sintering. J. Antill and M. Gardner. Paper from "Developments in the Practice of Compacting and Sintering", Iron and Steel Institute and the Institute of Metals, p. 50-63.

Method of firing developed called "zone sintering" simplifies methods for making dense tubes and rods from powders. The technique is analogous to zone melting and consists of steadily passing a furnace at the sintering temperature over the "green ware". The method has been applied to thorium, uranium and "Hylumina" (an alumina-base refractory). (H15n; Th, U)

105-H.* (Rumanian.) **Effect of Sintering Degree on the Properties of the Double Ferrites of Nickel.** Elena Labusca and Gheorghe Stanku. *Studii si Cercetari de Metalurgie,* v. 2, no. 4, 1957, p. 483-490.

Increase of maximum sintering temperature leads to increase of density and magnetic permeability and decrease in electrical resistivity. For a certain composition of the ferrite it is thus possible to obtain sintered materials with different properties as a function of the degree of sintering. 7 ref. (H15, P10a, P15g, P16q, 2-61; Fe, Ni, 6-72)

106-H. (Book.) **Developments in the Practice of Compacting and Sintering.** Powder Metallurgy Joint Group of the Iron and Steel Institute and the Institute of Metals, Mar. 19, 1958, Church House, London, S.W.1, England.

(H16, P16, J27; Al, Ni, Fe, *Cu*, SGA-n)

118-H. Powder Metallurgy Comes of Age. Robert Talmage. *SAE Journal*, v. 66, July 1958, p. 44-47.

Procedures and advantages of powder metallurgy techniques. (H-general)

119-H.* Powder Metallurgy of Uranium and Thorium. Alan Blainey. *Metal Progress*, v. 74, Aug. 1958, p. 79-84.

Powders derived from alternative production methods vary greatly in size and shape, thus affecting "compactibility" either hot or cold. Surface oxide or compounds may prevent atomic diffusion across particle boundaries during sintering and result in weak or brittle parts. Cermets made from oxide or carbide particles have been used extensively in test reactors and components. (H-general, T11, 17-57; U, Th)

120-H.* Getting More From Metal Powders. *Metal Progress*, v. 74, July 1958, p. 101-104.

Powder metallurgy holders for carbide tools look promising; metal powders solve barrel finishing problems; slip casting expands potential for large, complicated parts from powders. These were among the new developments reported at the annual meeting of the Metal Powder Association. (H-general)

121-H. (Russian.) **Method for Determination of the Dimensions of Particles of Aluminum Powder.** I. N. Varlamova and B. P. Golubev. *Zavodskaya Laboratoriya*, no. 1, 1956, p. 80-82.

Rapid determination using a single 0.1-g. sample of the powder, by measuring average thickness of particles on the basis of the surface area occupied by the sample when it is distributed in a continuous single layer on water, and average transverse dimension of the particles under the microscope. (H11j; Al)

122-H.* (French.) Powder Metallurgy. General Development and Future Possibilities in the Field of Refractory Machine Parts and Cermets. R. Kieffer and R. Meyer. *Chimie et Industrie*, v. 79, May 1958, p. 589-599.

Properties and uses of cermets composed of oxides and metals, carbides and metals, borides and metals, nitrides and metals, sulphides and cermets with intermetallic phase. Techniques employed in manufacture of cermets; some metallurgical considerations. 123 ref. (Conclusion.) (H-general, 6-70)

123-H.* (French.) **Influence of Double Compaction on the Kinetics of Sintering of Agglomerates of Carbonyl Iron.** Georges Cizeron. *Comptes Rendus*, v. 246, May 28, 1958, p. 3060-3063.

Role of grain boundaries in elimination of pores from a sinter is illustrated by technique of double compaction and double sintering. Fragmentation of a structure which has undergone grain growth by annealing in the gamma phase causes elimination of pores and re-acceleration of speed of densification when material is resintered in alpha phase. (H15; Fe)

124-H. Furnace Sintering of Metals and Ceramics. Pt. 1. R. L. Harper. *Industrial Heating*, v. 25, Aug. 1958, p. 1530-1532, 1534, 1536, 1538.

Types of furnaces used and processes involved in making parts by sintering compacted powders of metals and ceramics (individually or combined), and metallizing of certain ceramic parts.
(H15, W26e; 6-68, NM-f)

125-H.* A Preliminary Study of the Production and Properties of Beryllium Sheet. N. A. Hill. *United Kingdom Atomic Energy Authority, AERE M/M 193*, 1958, 15 p.

Room-temperature tensile tests on beryllium sheet rolled from hot extruded, hot forged and cold compacted electrolytic powder show that maximum elongation in the plane of the sheet was obtained from cross-rolled hot forged powder. Cold bend tests were able to distinguish between unidirectionally rolled and cross-rolled sheet. 10 ref. (H14, Q5; Be, 4-53)

126-H. Fundamentals of Sintering. Pt. 2. A. L. Pranatis, L. S. Castelman and L. Seigle. *U. S. Atomic Energy Commission SEP-247*, 1958, 32 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Rates of spheroidization and densification of Au and Ni wire compacts were measured as a function of time, temperature and wire size. The necks joining the sintered particles were found to grow proportionally to the one-fifth root of time. The value of the coefficient of self-diffusion calculated from the sintering rate is of the same order of magnitude as that obtained by ordinary tracer techniques but with a somewhat higher activation energy. (H15)

127-H.* (Russian.) **Efficient Method for Production of Hard Alloy Drawing Blocks for Tubemaking.** G. S. Maksimovich. *Stal'*, v. 18, July 1958, p. 629-633.

Production of heavy-duty drawing blocks by means of hot pressing a compact into a steel race followed by mechanized grinding and finishing has considerably increased speed of tube drawing and resulted in great savings in drawing tools, as result of greater durability of drawing blocks. 4 ref.
(H14h, F26r, 1-52)

128-H.* (Book.) **Tooling for Metal Powder Parts.** George H. De Groat. 242 p. 1958. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York 36, N. Y. $7.50.

Advantages and economics in comparison to other production processes. Considerations of size, geometry, density requirements, required physical properties and surface finish in the design of structural metal powder parts; production properties and utilization of metal powders; powder preparation and conditioning. Comparison of briquetting pressed types, compacting practice. Data on relation of density to briquetting pressure, depth of fill, particle size and properties. Calculations involved in determining materials and design of punches, core pins, rods and dies. Die designs for specific parts; sintering methods, sintering atmosphere, furnace types. Sintering times and temperatures for various powders. Relation of sintering temperature and time to mechanical properties, density, shrinkage and swelling. Coining, sizing, machining, cleaning, tumbling, impregnating, infiltrating, electroplating, resintering and heat treating operations. 115 ref. (H-general, W26)

129-H. (Russian.) **Study of Certain Laws of Dispersion Hardening of Metal-Ceramic Alloys of Iron-Copper-Carbon.** G. I. Aksenov and V. K. Sorokin. *Poroshkovaya Metallurgiya, Yaroslavl'*, 1956, p. 71-77.

A greater increase in hardness has been observed in Fe-Cu-C metal-ceramic alloys than in copper steel compacts, and more time is required to reach maximum hardness. As the porosity of the specimens increases, the growth in hardness slows down, and the maximum value of hardness increment increases. Increasing Cu content reduces rate of

strengthening, a fact most noticeable at high temperature. Additional pressing of the sintered specimens causes a rapid increase in hardness during the first hours of soaking.
(H15, H16; Fe, Cu, C, 6-70)

130-H. (Russian.) **Strength of Metal-Ceramic Hard Alloys of Tungsten Carbide and Cobalt.** P. S. Kreymer. *Poroshkovaya Metallurgiya, Yaroslavl',* 1956, p. 115-126.

Optimum combination of wear endurance and strength in WC-Co alloys can be obtained by crumbling the grain with a relatively increased content of Co, or increasing the grain (to 3 to 4 microns) with a relatively reduced content of Co. The energies of the second method are proved. (H-general, Q27a, Q9n; Co, W, C, 6-70)

131-H. Cermet Preparation by Reactions in the Iron-Aluminum-Oxygen System. A. Siede and A. G. Metcalfe. Illinois Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131820, Oct. 1957, 42 p. $1.25.

Investigation to determine if better bonding and finer distribution of aluminum oxide in a metallic matrix could be achieved by method described, and whether the improved structure would have superior properties. Reactive sintering process studied by metallography, thermal analysis and mechanical testing. Excellent bonding between alloy matrix and oxide was found after reactive sintering, but the density was low.
(H15; Al, 6-70)

132-H.* (German.) **Influence of Heating Atmosphere on Oxidation of Zinc Powder.** G. Ogiermann and H. Weik. *Metalloberfläche,* v. 12, July 1958, p. 199-201.

Gravimetric experiments on oxidation indicate influence of heating atmosphere and grain size. Heating in air produces greater oxidation than in nitrogen. Oxidation was greatest for fine-grained powders. An unexpectedly large oxidation inhibiting effect results from the alligatoring of the oxide powder on expansion. 6 ref. (H15q, R1h; Zn)

133-H. (Russian.) **Investigation of the Sintering Process of Certain Metal Powders.** V. V. Saklinskiy. *Poroshkovaya Metallurgiya, Yaroslavl',* 1956, p. 21-51.

During sintering a contact is formed and made closer between particles of the powders as a result of diffusion processes, caused by the temperature mobility of the atoms. Surface diffusion predominates during the initial stage, while volume diffusion predominates in the final stage. Formation of the contact is attributed to forces causing plastic diffusion of the powder particles, and to the action of surface tension that results from liquidation of defects of the crystalline lattice. (H15, N1)

134-H.* (Japanese.) **Alumina Base Cermets. Pt. 2. Effects of Additives on the Adhesion Between Alumina and Iron.** H. Matsumoto, S. Yamauchi and G. Nishiyama. *Nagoya Industrial Experimental Station, Report,* v. 7, July 1958, p. 543-552.

To improve the adhesion between Al_2O_3 and Fe, effects of additives (i.e., MgO, CaO, MnO_2, TiO_3, Al_2O_3, TiO_2, SiO_2 and Cr_2O_3) are studied. Base mixture is 33.5% Al_2O_3 and 66.5% Fe by weight. In the sintering process sweating is observed. Contact angle, bending and compressive strengths at room temperature and shrinkage of the specimens are measured. Contact angle between Al_2O_3 and Fe in A gas flow is 146° C. To make this angle smaller MgO, MgO_2, SiO_2 and TiO_2 additives are useful. If CaO and Si are mixed in the same time, almost no sweating is observed.
(H12n; 6-70)

135-H. Study of the Possibility of Reinforcing High-Temperature Alloys by Addition of Refractory Powders. John D. Burney. Metallurgical Research Laboratory. *U. S. Office of Technical Services,* PB 131768, Feb. 1958, 49 p. $1.25.

Attempt to reinforce 80-20 Ni-Cr alloy by addition of such refractory oxides as TiO_2 and Al_2O_3. Several powder metallurgical fabrication techniques were investigated such as pressing and sintering, pressing and sintering followed by various working procedures, internal oxidation and liquid phase sintering.

136-H.* **Electrolytic Production of Straight and Alloyed Metal Powders.** I. Ljungberg. *Iron and Steel Institute, Journal,* v. 189, Aug. 1958, p. 303-306.

Electrolytic production of Fe, Ni and ferro-alloy powders used in Sweden over the last ten years. Advantages of using indirect method where brittle product is deposited on cathode and later ground. Suitable electrolyte solution and anode materials. Physical properties of metal powders and properties of sintered alloy steel produced from powders. 13 ref. (H10b; Fe, Ni)

137-H.* Powder Metallurgy of Refractory Metals. Alan Blainey. *Metal Progress,* v. 74, Sept. 1958, p. 95-96, 184, 186, 188, 190.

Hydrostatic compaction, extrusion of canned powders and compression within deformable frames are interesting techniques utilized for cladding fuel elements with pure refractory metals and making special shapes for atomic power reactors. (H-general, T11g; Zr, Cb, V, Be, Mg)

138-H.* (German.) Sintered Shapes; Production and Use. A. Hohmann. *Giesserei Praxis,* no. 15, Aug. 10, 1958, p. 294-295.

Raw materials for sintered shapes are iron, bronze and brass. Powders made by mechanical reduction, by pulverization or electrolytically. Pressing and sintering. Outstanding characteristics are wear resistance and density. Disadvantages are high production costs, expensive tools, high pressing and heating costs, consumption of "atmospheres" used in heating. Sintered parts are used in sewing machine, office machine and automobile industry. (H-general)

139-H. Routine Apparatus for Determining the Surface Area of Metal Powders. P. Hersch. *Institute of Metals, Journal,* v. 86, Aug. 1958, p. 509-511.

Simplified version of the low-temperature, nitrogen-adsorption technique for determining specific surface area of metal powders. Modified method involves determination of one point only of the adsorption isotherm; the dead space is estimated without the use of helium, and the amount of ancillary equipment required is much reduced. 5 ref. (H11j, 1-53)

140-H. Slip Casting. Its Field Broadens. L. M. Schifferli, Jr. *Product Engineering (Design Edition),* v. 29, Oct. 13, 1958, p. 84-85.

Method able to produce intricate, larger parts; adaptable to stainless steel, titanium. (H14; SS, Ti)

141-H.* (German.) Sintering of Beryllium Powder Without Pressure. T. R. Barrett, G. C. Ellis and R. A. Knight. *Planseeberichte für Pulvermetallurgie,* v. 6, Aug. 1958, p. 39-47.

Electrolytic Be is refined by vacuum melting; chips are produced and powdered in ball mill. Graphite molds are filled and jolted, followed by sintering in a vacuum induction furnace at 1200-1220° C. for 6 hr. The metal obtained is machinable. (H10e, H15; Be)

142-H. Effect of Carbon on the Quality of Sintered Carbides of the W-C-Co Type. M. Petrdlik and V. Dufek. *Hutnické Listy,* v. 10, no. 9, 1955. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB152.)

143-H.* Slip Casting of Metal Powders. Henry H. Hausner. *Powder Metallurgy Bulletin,* v. 8, June 1958, p. 53-67.

Selecting, weighing, mixing, stirring, degassing, pouring and molding of slip mixture. Casting is then trimmed, dried and sintered. Compares properties of slip and compact sintered powered metals. Chemical analysis, particle size distribution and apparent density of Type 316 stainless steel powder; relationship between viscosity and pH value for slip casting. (H10h; SS)

144-H.* Continuous Production of Strip From Metal Powder by the Direct Rolling Process. D. K. Worn. *Sheet Metal Industries,* v. 35, Aug. 1958, p. 615-619.

Broad capabilities and limitations of the process considered from technical and economic points of view. Recent development makes this process competitive with conventional methods for production of Ni and Cu strips, and in specialized fields where materials must be produced by powder metallurgy. 17 ref. (H14j; Ni, Cu, 4-53)

145-H. (Russian.) Effect of Nonmetallic Additions on the Strength of Platinum at High Temperatures. I. F. Belyaev. *Tsvetnye Metally,* no. 6, 1957, p. 57-61.

Addition of metal oxides to Pt powder increases its strength at 1200° C. by several times without reducing ductility and corrosion resistance. The high heat resistance of powder with metal oxide additions is explained by the presence

of disperse oxide particles disposed along the grain boundaries and inside the grains, and also by the structure, which possesses a smaller grain size and a fine mosaic structure. (H12, Q27a, 2-62; Pt, AD-q40)

146-H.* Vacuum Reactions of Niobium During Sintering. William D. Klopp, Chester T. Sims and Robert I. Jaffee. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 106-120.

Purification of powder-metallurgy Cb bars by removal of oxygen, nitrogen and carbon during vacuum sintering at 2000 and 2150° C. was investigated. Mixtures of columbium oxide and columbium carbide were analyzed after sintering at 1500 to 2150° C. The thermal stabilities of commercial purity columbium oxide, columbium nitride and columbium carbide investigated by heating in vacuum up to 2150° C. Mechanisms for removal of oxygen, nitrogen and carbon during high-temperature vacuum sintering. 19 ref. (H15, 1-73; Cb)

(H14; 6-70)

148-H. Sintering of Metal Powder Mixtures, System Copper-Nickel. Similarly Shaped Powder Particles. Y. E. Geguzin. *Fizika Metallov i Metallovedenie,* v. 2, no. 3, 1956, p. 406-417. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB4.)

Previously abstracted from original. See item 132-H, 1956. (H15; Cu, Ni)

149-H. Aluminum Powder Metallurgy. F. V. Lenel, A. B. Backensto and M. V. Rose. Rensselaer Polytechnic Institute. *U. S. Office of Technical Services,* PB 121136, June 1955, 85 p. $2.25.

Procedures used at Rensselaer Polytechnic Institute in producing Al powder extrusions from flake pigment powders and from atomized powders. Powder properties and mechanical properties of the extrusions were tested. Yield strength at room temperature and at 400° C. increased directly with the square root of the reciprocal of the average flake thickness; weight per cent of oxide was not as important as the flake thickness in strengthening the extrusions. (H14k, Q-general; Al, 4-58)

150-H. Investigation of Molybdenum and Molybdenum-Base Alloys Made by Powder Metallurgy Techniques. W. L. Bruckart, C. M. Craighead and R. I. Jaffee. Battelle Memorial Institute. *U. S. Office of Technical Services,* PB 127913, Jan. 1955, 172 p. (Available at Library of Congress, Washington, D. C.—Microfilm $8.10; Photostats $27.30.)

Hydrogen sintering and vacuum sintering studied for the following addition elements: Al, B, Be, C, Cb, Co, Cr, Fe, In, Mn, Ni, P, S, Si Sn, Ta, Th, Ti, V, W and Zr. Evaluation of alloys made with these elements included room-temperature strength, hardness, bend ductility, hot hardness, creep characteristics and resistance to recrystallization. The following oxides were studied as additions to Mo: Al_2O_3, BaO, CaO, CeO_2, Cr_2O_3, MgO, SiO, SrO, ThO_2 and ZrO_2. (H15, 2-60, Q-general; Mo)

151-H.* Porous and Infiltrated Metal. J. E. Elliott. *Birmingham Metallurgical Society Journal,* v. 38, Sept. 1958, p. 105-128.

Selection of powders, mixing, compacting, press tools, sintering, sizing, impregnation of Cu-Sn and Cu-Fe products. (H-general; Fe, Cu, Sn)

152-H.* (German.) **Grain Growth Retarded by Trace Elements in Carbonyl Sintered Iron.** Gunther Weise and Friedrich Erdmann-Jesnitzer. *Bergakademie,* v. 10, May-June 1958, p. 316-321.

Four groups of samples tested: Fe + 0.02 to 0.08% C, Fe + 0 to 0.1% N, Fe + 0.05 to 0.3% P, Fe + 0.05 to 0.2% Cu. Grain growth retarded in proportion to the amount of alloying element. This was observed in vacuum sintering but occurred in hydrogen sintering only when P was the alloying element. 10 ref. (H15q, N3; Fe)

153-H.* (Russian.) **Compacting Ternary Mixtures of Metallic Powders.** B. Ya. Pines and A. F. Sirenko. *Fizika Metallov i Metallovedenie,* v. 6, no. 2, 1958, p. 261-267.

Investigation of systems Cu-Fe, Ni-Fe and Cu-Ni showed that objects made of ternary mixtures of metal powder, subject to compacting, have a tetragonal relationship (as to the degree of shrinkage and endurance limit) to the degree of concentration. Previous studies and conclusions as to shrinkage and endurance limit of binary alloys are fully applicable to ternary alloys. 4 ref. (H14, P10d, Q7; Cu, Fe, Ni)

38-J. Vacuum Heat Treating Hairsprings. Tom Raedy. *Steel,* v. 141, Oct. 21, 1957, p. 94-97.

Hairsprings of Ni-Span "C", a Ni-Cr-Fe-Ti alloy and other metals heat treated in vacuum to prevent surface oxidation.
(J2k, 1-73, T7c; Ni, Cr, Fe, Ti)

39-J. (Dutch.) **Cost Saving by Isothermal Soft Annealing.** C. H. Luiten. *Metalen,* v. 5, Oct. 15, 1957, p. 391-394.

In the initial shaping of knives and scissors by warm forging, the steel is usually heated beyond the hardening temperature. In normal cooling in air hardness increases. Hence a soft annealing treatment is necessary after forging to improve machinability. The separate annealing treatment can be successfully replaced by isothermal annealing, in which the cooling from forging temperature at 700° C. is interrupted for some time. (J23s; ST)

40-J. (German.) **Hardened Copper-Titanium-Aluminum Alloy.** W. Gruhl and H. Cordier. *Metall,* v. 11, Nov. 1957, p. 928-933. (CMA)

By addition of titanium and appropriate heat treatment, copper can be appreciably hardened. The procedure has never been industrially applied. Satisfactory results can be had by adding Al together with Ti. The alloy was heated at 800° C. for 5 hr., quenched in water or air for a few minutes, and hardened by a prolonged annealing at 350-500° C. 11 ref. (J23, J26; Cu, *Ti, Al*)

41-J.* (German.) **Heat Treatment of Toolsteels.** Josef Frehser and Otmar Lowitzer. *Stahl und Eisen,* v. 77, Sept. 1957, p. 1221-1233.

The mechanism of the change in dimensions during heat treatment of nonhardenable steels and toolsteels with different quenching temperatures. Effect of thermal and transformation stresses in behavior of steels and in dimensions of tools during heat treatment. 13 ref.

46-J.* Annealing of Steel Sheet. G. W. Form and E. B. Evans. *Metal Progress,* v. 72, Dec. 1957, p. 111-112, 142.

While batch annealing takes hours, the product is softer and more desirable for deep drawing than that from the rapid continuous annealing. "Snakes" (a ripply surface) are suspected to be subsurface oxides, and they form even when the standard D-X atmosphere is maintained during annealing. Directional orientation of microstructure and strain aging characteristics are still matters which require correction in tonnage mill products. (J23; Cn, 4-3)

47-J.* **How to Make Invar Stay Put.** Warren S. Eberly. *Product Engineering,* v. 28, Dec. 9, 1957, p. 80-81.

Special heat treatments to stabilize dimensions and themal coefficients. This coefficient value reaches a minimum at 36% Ni and increases rapidly with small changes in Ni content. Nickel must be held between 35.5 and 36% to assure consistent behavior in service.

Wide variations in the hardness and microstructure of U-Ti alloys (8.5, 25.5 and 50 at. % Ti) may be effected by suitable heat treatments, especially quench-temper and isothermal transformation. Slow-cooled specimens were softer and there were no great changes with Ti content. Hardness achieved by quenching from the $\beta + \varepsilon$, $\gamma + \varepsilon$ and γ fields are compared. Shattering occurred on quenching from the γ field because of the volume changes attendant on U_2Ti. High hardness resulted when alloys were quenched from regions where U_2Ti is stable. 4 ref. (J26, Q29n, M27; U, *Ti*)

181-J. (German.) **Annealing of Iron and Other Metals in Controlled Atmosphere Containers.** Werner Herdieckerhoff. *Draht*, v. 9, Apr. 1958, p. 141-143.

Use of high vacuum. (J23, 1-73)

182-J.* (German.) **Longer Tool Life Through Selective Electric-Spark Hardening.** E. Hanke. *Fertigungstechnik*, v. 8, Feb. 1958, p. 53-59.

Hardening occurs through electric discharges applied repeatedly to the bearing areas of the surface. Equipment used. Abrasion resistance of the treated surface increased by 100-450%. Micro-examination of tested surfaces showed that high surface hardness is due to the structural changes occurring during electric heating above the transformation range and then cooling, which causes a carbide particle precipitation in the treated metal and refutes the theory that surface hardening is caused by a hard metal layer deposited on the surface during treatment. 10 ref.

207-J. New Method Speeds Annealing. *Metal Progress,* v. 73, June 1958, p. 97-98.

Coils of carbon steel from cold mill are rewound to provide space between laminations. This speeds up heating and cooling, improves temperature uniformity. A recuperative method salvages heat from cooling coils for use in preheating cold coils. The new system promises a significant reduction in annealing costs. (J23; 1-55; ST, 4-53)

208-J. Two Steps to Heat Treat Savings. *Steel,* v. 142, June 16, 1958, p. 100-101.

Induction hardening of critical areas of automotive steering knuckles to boost fatigue life permits use of less expensive steel; a switch from press quenching to hot oil quenching. (J2g, J26n, T21c; ST)

209-J. Grain Refinement of Uranium by Heat-Treatment and Alloying. E. E. Hayes. Paper from "Fuel Ele-

ments Conference", U. S. Office of Technical Services, TID-7546, p. 75-101.

Practical refinement of grain structures in unalloyed uranium is based on rapid cooling through the beta-alpha phase transformation. Additional refinement of rapidly cooled uranium may be obtained by a recrystallization process during a short-time anneal in the high-alpha phase. Alloys of uranium containing up to several per cent additive that can be used for grain-size control. Chromium, silicon and zirconium are among the most effective grain-refining elements. 15 ref. 229-J. Improved Heat Treating Practices for Some Forged Auto Parts. A. E. Shevelev. *Metallovedenie i Obrabotka Metallov,* v. 4, Apr. 1958, p. 45-49. (Henry Brutcher, Altadena, Calif., Translation no. 4188.)

The stability of the austenite in the normalizing and heat treating of a forging depends on the preceding hot plastic deformation; the greater the degree of forging the greater the magnitude of the residual stresses and the less stable the austenite. An increase in the austenitization temperature or in the exposure time to austenitization leads to partial decomposition of the solid solution and the precipitation of ferrite, the intensity of the process increasing with the austenitization temperature.

Selection of toolsteel; correct heat treatment; grinding of hardened tools; design; operating conditions. Typical high speed, hot work and cold work steels described. (J-general; TS)

236-J.* Effects of Heat Treatment of Thin Ferromagnetic Films at Intermediate Temperatures. E. N. Mitchell. *Journal of Applied Physics,* v. 29, Mar. 1958, p. 286-287.

Iron-nickel films deposited in vacuo in the presence of a magnetic field were annealed in an inert enviornment. When the annealing is performed in an orienting field of 30 o.e., initial magnetic properties of these films can be altered provided the initial temperature is high enough. If a field is applied at right angles to the original preferred direction and in the plane of the film, the magnitude of the magnetic anisotropy can be reduced without changing the preferred direction; the preferred direction of magnetization can be changed if the anneal temperature is sufficiently high. (J23, P16; Fe, Ni, 14-62)

237-J.* Controlled Atmospheres for Metallurgical Processes. Pt. 1. I. L. S. Golding. *Metal Treatment and Drop Forging,* v. 25, June 1958, p. 221-226.

Heat treatment processes which are best performed in neutral or active reducing atmospheres; underlying chemical reactions. (J2k)

Several important factors which manufacturers should consider in deciding whether to do their own heat treating or subcontract it. (J-general, A5b)

253-J. Surface Hardening of Carbon Steels by High-Temperature Dry Cyaniding. O. K. Kotov. *Metallovedenie i Obrabotka Metallov,* May 1958, p. 16-20. (Henry Brutcher, Altadena, Calif., Translation no. 4217.)

High-temperature dry cyaniding is an improvement on gaseous nitrocementation. Full saturation with nitrogen increases speed of diffusion and eliminates sooty deposits. Chief advantage is raising the fatigue limit. Wear resistance is increased 83% by case hardening, 93% by gaseous nitro-cementation and 172% by high-temperature gas nitro-carburization. 7 ref. (J28j, Q9; CN)

272-J. (Russian.) **Electron Microscope and X-Ray Study of Aging of Al-Ag Alloys.** R. M. Lerinman and N. N. Buinov. *Fizika Metallov i Metallovedenie*, v. 5, no. 2, 1957, p. 279-292.

Al alloys with 20% Ag become considerably strengthened in aging process. Comparison of electron microscopic structural changes at different stages of aging process with unchanging anamolous diffraction effects on radiograms shows that the results from both methods of investigation fully correspond. 25 ref. (J27d; *Ag*, Al-b)

273-J.* **Protective Gases, Their Production and Application.** Gerhard Simon. *AEG Progress*, no. 5, 1957, p. 234-240.

Oxidation of metallic materials during heat treatment can be avoided when carried out in a vacuum, a salt bath or protective atmosphere. The latter, with pure H_2, mixtures of N_2 and H_2 or H_2, N_2, CO and CO_2 with the products NH_3, town gas or propane, attained its highest degree of technical and economic importance after equipment was developed and the production became simple and cheap. Methods of production. Types of furnace for their use. (J2k)

274-J.* (Russian.) **Formation of Nonuniformity in Fusing Zone of Weld.** L. S. Livshits and S. I. Panich. *Svarochnoe Proizvodstvo*, Apr. 1958, p. 22-25.

Heating welds to temperatures of 500 to 700° can produce carbon flow from one part of weld to another and leads to strong chemical and structural nonuniformity in fusing zone. After-heating to 950° will deconcentrate carbon and eliminate nonuniformity. 5 ref.
(J-general; ST, 7-51)

275-J. (Book.) **Definitions of Terms Used in the Heat Treatment and Testing of Metals.** 2nd Ed., 88 p., 1957. Australian Institute of Metals, 18 Queen St., Melbourne, C1, Australia.

Chemical, physical and mechanical properties connected with heat treatment. (J-general; 11-67)

276-J.* **Stress Relieving of Stainless Steels and the Associated Metallurgy.** R. A. Huseby. *Welding Journal*, v. 37, July 1958, p. 304s-315s.

Mechanical properties of the austenitic Cr-Ni stainless steels appear to be only mildly affected by fabricating operations; stress relieving usually is employed only for conditions where severe stress corrosion may be encountered, or for a high degree of dimensional stability. Thermal stress relieving of the ferritic Cr stainless steels after fabrication is necessary to obtain the desired mechanical properties and corrosion resistance. Martensitic stainless steels require preheating and high interpass temperatures during welding and immediate postheating after welding to avoid cracking. 19 ref.

277-J.* (Italian.) **Carbonitriding Process.** G. Limentani. *Metallurgia Italiana*, v. 50, May 1958, p. 191-195.

Process and properties imparted to steel and alloy steel parts; residual austenite and methods of reducing same to minimum; tempering characteristics of carbonitrided steels as compared with those of casehardened steels. Description of carbonitriding furnace.
(J28m, W27n; ST)

278-J.* **Getting the Most From a Drying System.** James E. Greever. *Metal Progress*, v. 74, July 1958, p. 83-85.

Very low dew points (−95° F.) are required for the manufacture of transistor metals, annealing stainless, and sintering many powder compacts. Even a well-designed drying system will fail to produce such gas unless the purging gas used while regenerating the activated alumina silica gel is equally dry. (J2k, W28q)

279-J.* **Heat Treating Affects Aluminum Extrusions.** J. K. McLaughlin. *Metal Progress*, v. 74, July 1958, p. 105-107.

Aluminum extruders like to "homogenize" 6063 Al billets before extruding (this raises the strength of the product). Treatment discussed, along with the quantitative effects of several variables.
(J21; F24; Al-b)

280-J.* (German.) **Nitriding Titanium Steels.** L. Gillemot and M. Tomory. *Periodica Polytechnica*, v. 2, no. 1, 1958, p. 1-17.

Titanium steels require less nitriding time and the Ti:C ratio determines the resulting surface hardness. On steels with Ti:C $<$ 4 the

nitriding produces a comparatively soft layer with gradual transition to the core; in steels with Ti:C > 4, it produces a harder layer. The hardness increases with increasing Ti:C ratio. Test nitrided bars with sharp notches show approximately 50% greater fatigue limit than annealed unalloyed steel. 19 ref.
(J28k; AY, *Ti*)

281-J.* (German.) **Effect of Annealing on the Precipitation of Aluminum Nitride and on the Mechanical Properties of Plain Carbon Steels.** Paul Werthebach and Hubert Hoff. *Stahl und Eisen,* v. 78, May 29, 1958, p. 736-743.

Influence of temperature used in rolling and heat treating on the amount of nitrogen combined with Al in blown steels and openhearth steels containing 0.06 to 0.42% C, 0.04 to 0.17% Si, 0.4 to 0.32% Mn, 0.04 to 0.20% Al and 0.003 to 0.011% N. Rate of dissolution of aluminum nitride during heating and rate of precipitation in cooling at various temperature ranges. Relates the fixation of nitrogen to Al in deep drawing steels to the elongation in the yield point range and the formation of stretcher lines. Relation between the susceptibility to aging and the difference in the tensile strength at 20 and 200° C. Effect of the normalizing treatment of steels containing Al on the notch toughness and grain size.

284-J. High Temperature Carburizing Is Practical. *Steel,* v. 143, Aug. 4, 1958, p. 98-100.

Tests on AISI 1117 carbon steel, 4615 Ni-Mo steel and Ni-Cr-Mo steels 8620, 9315. (J28g, 1-66; CN, AY)

285-J.* (German.) **Effect of Working Conditions on Mechanical Properties When Patenting Rope Wires After Electric Resistance Heating.** Werner Lueg and Karl Schemmer. *Stahl und Eisen,* v. 78, July 10, 1958, p. 960-965.

Process of patenting 0.4, 0.6 and 0.8% carbon steel wires, prepatented, rolled and drawn into 3-mm. rope wires after direct resistance heating at 20 to 50 m. per min. and temperatures from 20° C. over Ac_3 to 1000° C., and indirect resistance heating in gas oven at 10 m. per min. and 880° C. Wires, drawn 12 times and reduced by 93% to 0.75 mm., were examined after each pull to detect influence of patenting process on mechanical properties. Patenting preceded by resistance heating generally improves the wire and diminishes dispersion as long as operating conditions permit an almost complete austenitization and extensive isothermal conversion when passing through quenching bath.
(J25, Q-general, 3-68; ST, 4-61)

286-J.* (Russian.) **Speeding the Aging Process of Aluminum-Magnesium Alloys by Small Admixtures of Silver and Zinc.** V. I. Arkharov, I. P. Berenova and L. M. Magat. *Fizika Metallov i Metallovedenie,* v. 5, no. 5, 1957, p. 516-526.

By measuring the lattice parameters of hard alloys during aging it was established that admixtures of 0.2-1.0% Zn and Ag speed the aging process of Al-Mg alloys. Study of ternary system Al-Mg-Zn shows that major factor in speeding aging is the internal adsorption of Zn into periphery of crystals of decomposing hard alloy. 13 ref.
(J27d, M24c, 2-60; Al, Mg, *Ag, Zn*)

287-J. Accelerated Aging of Heat Resistant Nickel Alloys Under Effect of Ultrasonics. V. S. Ermakov and E. A. Al'ftan. *Metallovdenie i Obrabotka Metallov,* July 1958, p. 22-27. (Henry Brutcher, Altadena, Calif., Translation no. 4278.)

Ultrasonic waves of 20-26 kgts. frequency accelerate the aging process of alloys. Doubling the ultrasonic energy makes possible shortening of aging period by 40 to 50 times. Application of ultrasonics during aging at 800° makes it possible to eliminate effect of coagulation and hardening of alloy is 15 to 20 times faster than under usual procedure. 6 ref.
(J27d, 1-74; Ni-b)

288-J. Nitriding of High-Strength Magnesium Cast Iron. Yu. M. Lakh-

tin and D. S. Pinchuk. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 39-42. (Henry Brutcher, Altadena, Calif., Translation no. 4282.)

The nitrided surface of Mg-Fe has great hardness and corrosion risistance in water. Nitriding of nodular iron requires much less time than steel or usual irons; nitriding at 650° to obtain surface depth of 0.16 mm. requires only 1 hr. and for depth of 0.35 mm., 3 hr. For best nitriding results it is recommended that Mg-Fe with a ferrite pearlite base be used at a diffusion temperature of 720-740°. 5 ref. (J28k, Q29n; CI-r, *Mg*)

289-J. Improved Processing of Cold Rolling Roll Banks of 9XF Steel. I. E. Brainin, A. I. Kondrashov and V. A. Kharchenko. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 43-46. (Henry Brutcher, Altadena, Calif., Translation no. 4283.)

Use of 9XF steel made in basic openhearth has replaced eutectoid steels for roll banks because of its greater resistance to crack formation and flocculation. Rapid grain growth takes place at 950° when the secondary carbides dissolve in the austenite. Raising the austenizing temperature from 830 to 960° increases the stability of cooled austenite. The suggested two-stage isothermal treatment eliminates need for normalizing in order to destroy flocculation in carbide lattice. (J22, W23k; ST-e)

290-J. Effect of Heat Treatment on Wear Resistance of Steel in Soil Mass. N. M. Serpik and M. M. Kantor. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 46-50. (Henry Brutcher, Altadena, Calif., Translation no. 4284.)

Isothermal treatment of steels used in road building machinery produces greater wear resistance than usual hardening methods followed by tempering. Tests show that isothermally treated steel has 1.5 greater wear resistance than Lemesh (plowshare) steels. (J26p, Q9n; ST)

291-J. Effect of Barium Acetate on Activity of Hard Carburizers. L. K. Luksha. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 50-52. (Henry Brutcher, Altadena, Calif., Translation no. 4285.)

The high activity of carburizers (10-15% charcoal, 80% semi-coke from coal, barium acetate varying from 5-15%) as compared to carbonates is to be explained by the presence of acetone in the cementite formed during the decomposition of acetates. Presence of acetone in cementite permits elimination of charcoal and its replacement with material of high thermal conductivity. (J28g; ST)

292-J.* (Russian.) **Carbide Separation on Tempering of Alloy Steel.** A. V. Stepanov. *Metallovedenie i Obrabotka Metallov,* July 1958, p. 59-61.

Carbide separation takes place in final stage of tempering. The transformation of the cementite in the carbide alloy and the formation of carbide crystals requires a minimum temperature of 500°. Hardness begins to develop in high-alloy steel following 1 hr. exposure to constant temperature of 500°. It reaches maximum hardness at 550-600°, but rapidly declines after 625°. 4 ref. (J29, N8a; AY)

293-J.* (French.) **Cold Working of Aluminum Alloys Facilitated by Solution Heat Treatment.** Blaise Cliche. *Ingenieur,* v. 44, Summer 1958, p. 40-42.

Solution heat treatment for 0.040-in. thick sheet of aged 24S-T3 Alclad, consists of 10-sec. immersion in solution of potassium nitrate and sodium nitrate heated to 280° C. and quench in cold water or air. Permits cold working during first 5 hr. after treatment. Rapid cooling affords greater ductility. Speed of cooling governs speed of reversion to mechanical characteristics of previous aged condition. (J2?a; Al-b)

294-J.* (French.) **Carburizing. Measurement of the Depth of Carburized Layers.** Gerard de Smet. *Pratique des Industries Mecaniques,* v. 44, Mar. 1958, p. 64-68.

Structural changes in carburized steel; surface and homogeneous carburizing. Destructive and nondestructive methods of determining depth and hardness of carburized zones, including 30-sec. method employing new device called "Testorgraf" developed in Germany. (J28g, 1-54; ST)

295-J.* (French.) **Five Years' Observation of the "Sulfinuz" Process.** Y. de Villemeur. *Revue de Mecanique,* v. 4, Jan-Mar. 1958, p. 16-22.

Description of process; micrographic study of surface hardened steel specimens. Anti-seizure prop-

erties and conformability of Sulfinuzed machine parts as shown by laboratory tests and on basis of actual working conditions.
(J4c, Q9; ST)

296-J. Automatic Controls Guarantee Top-Quality Carburizing. P. M. Unterweiser. *Iron Age,* v. 182, July 3, 1958, p. 61-63.

Large continuous carburizing furnaces featuring accurate control of dew point, maintained case depth and carbon content to close tolerances for alloy steel railroad bearings. (J28g, W27n, X7g; AY)

297-J. (Hungarian.) **Effect of Titanium on the Surface Properties of Case-Hardened Steels.** Janos Prohaszka. *Kohaszati Lapok,* v. 91, Apr. 1958, p. 180-186.

9 ref. (J28; ST, *Ti*)

298-J.* (German.) **Effect of Gas Nitriding and Salt Bath Nitriding on Properties of Structural Steels. Pt. 3.** H. Wiegand and M. Koch. *Metalloberflache,* v. 12, Aug. 1958, p. 225-230.

Bend tests indicate that strength increases rapidly during the first salt bath process but soon reaches a limit. In the gas process there is a slower increase, but strength increases (beyond the salt bath limit) by continuing the process over a longer period. With alloy steels in salt bath, it is advisable to keep temperature near lower limit for increased endurance strength.
(J28k; ST)

299-J.* (German.) **Intergranular Oxidation of Cr-Ni-W Steels.** P. Csokan. *Metalloberflache,* v. 12, Aug. 1958, p. 230-232.

Fatigue caused by decarburization investigated. The uniform tempered sorbite showed a surface zone characterized by a bright network of decarburized material, probably along the primary grain boundaries. Only the hardening process seemed to affect this structure. Experiments with Cu electroplating to exclude oxygen gave good results.
(J4a, Q7; AY)

300-J.* (German.) **Bright Annealing With Controlled Atmospheres.** O. Meyer-Witting. *Metallwaren-Industrie und Galvanotechnik,* v. 49, May 1958, p. 195-201.

Removal of vapors resulting from rolling and drawing lubricants from the heating chamber is necessary. Besides protection against oxygen, reducing, recarburizing and nitriding, effects are available by adjusting composition of the gas. Use of hydrogen and of mixtures of N, H, CO and CO_2 prepared by incomplete combustion of fuel gases. Steam content more harmful with higher annealing temperatures, and causes more oxidation with long than with short cooling periods. (J23a, J2k)

301-J. How to Harden Steel Rolls. C. J. McCormick. *Iron Age,* v. 182, Aug. 28, 1958, p. 60-62.
(J22, J26p, W23k; ST)

302-J.* (German.) **Heat Treating With Medium Frequency.** H. Krake, W. Seifert and J. Mainka. *Fertigungstechnik,* v. 8, July 1958, p. 319-323.

Experiments with rough-turned gear blanks of heat treatable steel C 45, performed in a medium-frequency induction with 125-kw. generator. Correct hardening temperature was 850-870° C. For a tensile strength of 75-85 kg. per sq. mm. the tempering range was 670-680° C. Water was used as a quenchant. Prerequisites for good results: equal heat distribution to all points; thermostatic control of temperature; sufficient supply of water to insure fast and thorough quenching; use of normalized (in this case at 900° C.) material.
(J2g, T7a; ST)

303-J. (Russian.) **Effect of Holding Time During Tempering on the Mechanical Properties of Various Steels.** V. N. Semirog-Orlik. *Trudy Instituta Stroitel'nykh Mekhanizatsiya Akademii Nauk, Ukraniskii SSR,* no. 22, 1956, p. 70-80.

Effect of prolonging (up to 240 min.) the tempering of steels U7A, U10, U12A and SHKH15 at 200° C. on the magnitude of the stresses set up under conditions of all-round irregular stressed state with various related strains. Test pieces were pressed in pairs from steel 20 which was subjected to compression. Strength of U7A steel decreases smoothly with an increase in holding time to 180 min. while being annealed at 200° C. In steels U10 and U12 there was a large drop in strength for the first 20 min., and in steel SHKH15 for the first 60 min. After holding for over 180 min. the strength of all steels remains stable or increases.
(J29, Q27a; ST)

304-J. (Russian.) **Dispersion Hardening of Magnetically Soft Iron.** N. F. Vyaznikov. *Trudy Leningradskogo Politekhnicheskogo Instituta,* no. 180, 1955, p. 68-73.

Effects of annealing temperature, time of soaking and cooling conditions on the value of magnetizing force and of the permeability of commercially pure iron. Magnetic properties of annealed iron are affected principally by residual stresses. Study of mechanical properties as functions of the cooling conditions during annealing.
(J23, P16, Q-general; Fe, SGA-n)

305-J. The Use of Steel Forgings at High Strength Levels. C. E. Moeller. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 22-29.

Evaluation of austempering as a practical method of heat treatment to the 260 to 280,000-psi strength range, in 4350 steel. Comparison of austempered with quenched and tempered 4350 and 4340 steel.
(J26p; ST, SGA-b, 4-51)

306-J. A Practical Application of the Holloman-Jaffe Parameter to the Tempering of Type 410 Stainless Steel. Charles F. Lewis. Paper from "High Strength Steels for Aircraft", American Society for Metals, 1958, p. 77-81.

Holloman-Jaffe tempering parameter has been found useful for type 410 stainless in those ranges where the hardness-temperature curve is moving very rapidly. Published data supplemented by shop observations are treated statistically to arrive at a curve relating final hardness and the parameter T (20 + log t). This in turn is superimposed on curves relating the parameter with time and temperature so as to arrive at a simultaneous solution of the parameteric equations for the hardness required. 5 ref.
(J29q, Q29n; SS)

307-J.* (German.) **High-Frequency Induction Gear Hardening Processes.** G. Benkowsky. *Fertigungstechnik,* v. 8, June 1958, p. 241-246.

Processes for multiple-tooth hardening; single-tooth hardening; base hardening; new method of double-frequency multiple-tooth hardening. Steels suited for high-frequency hardening; normalizing; required generator efficiency. Resulting distortion lies within allowed tolerances. (J2g, T7a; ST)

308-J.* **The Pack Carburizing and Annealing of 4¼% Ni-Cr-Mo Case Hardening Steel.** C. Dawes. *Metallurgia,* v. 58, Aug. 1958, p. 69-75.

Influence of various carburizing compounds on the "as-quenched" hardness, microstructure, carbon content and annealing characteristics of the carburized case. Recommendations for a carburizing compound which will prevent the formation of heavy carbide networks and for a standard annealing treatment. Recommended procedures for annealing. (J28g, J23; AY, *Ni, Mo, Cr*)

309-J.* (Japanese.) **Austempering of Spring Steel.** Tsuneo Maenaka. *Metals,* v. 28, July 1958, p. 518-523.

Austempering process should be studied using continuous cooling transformation curve. Heat bath must be kept around 350 to 400° C. It is governed by cooling velocity, secondary bath temperature and cooling solution. High percentage of Mn (0.7 to 1%) is good for slow cooling. Fatigue tests and impulse test show that austempering is much better than ordinary tempering. Other mechanical characteristics are almost the same in both methods. (J26p, N8; ST, SGA-b)

310-J.* (Japanese.) **Electrolytic Heat Treatment.** Hiroshi Susukida and Yoshio Sakumoto. *Metals,* v. 28, July 1958, p. 530-534.

Stationary bath type, rotary bath type, nozzle type. Voltage is about 200 v. Nozzle type is better than bath type when large pieces are tempered. Partial and surface treatments are possible. Depth and degree of treatment can be controlled. Heating causes no oxidation and is rapid. Electrolyte can be used as cooling solution. (J2)

311-J.* (Japanese.) **Tempering and Mechanical Characteristics of High-Temperature Spring Steel.** Hidetsugu Hotta. *Metals,* v. 28, July 1958, p. 545-548.

9% W-Cr-V steel, Si-Mn steel, 13% Cr steel and 18-4-1 standard high speed steel are examined. Tempering is done around 500 to 1000° C. and tested under 50 to 200 kg. stress, 500° C. Hardness, fatigue and impulse tests are done. The 9% W-Cr-V steel is better than the others. The best tempering temperature is 1100° C. followed by holding in a heat bath of 600° C. for 9% W-Cr-V steel.

320-J. Study of the Factors Influencing the Properties of Heat Treatable Titanium Sheet Alloys. R. S. Richards, D. L. Day and H. D. Kessler. Titanium Metals Corp. of America. *U. S. Office of Technical Services,* PB 131769, Mar. 1958, 279 p. $4.

Properties of two Ti sheet alloys, Ti-4Al-3Mo-1V and Ti-2Al-6Mo-2V investigated in the annealed, solution treated and aged conditions.
(J27; Ti-b, 4-53)

321-J. Softening High-Alloy Carburized Steels. Yu. G. Vyshkovskii. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 43-46. (Henry Brutcher, Altadena, Calif., Translation no. 4321.)

To prevent decarburization during heating, test pieces were coated with Cr (20 mk. thick). The microstructure of carburized steel has a notable effect on surace hardness after softening treatment. Increased hardness is conditioned by presence in carburized surface of increased amounts of residual austenite and free carbides. To obtain satisfactory results in the softening treatment and to shorten length of process, it is necessary to avoid supersaturation of cementite layers with carbon by using a low-intensity carburization procedure.
(J28g, Q29; ST)

322-J.* (Polish.) **Influence of Ultrasonics Upon the Carburization of Steel.** Waclaw Rozanski. *Archiwum Hutnictwa,* v. 3, no. 2, 1958, p. 125-146.

Specimens of low-carbon steel containing 0.12% C were treated in a carburizing medium of 70% charcoal, 20% barium carbonate and 10% sodium carbonate at temperatures from 850 to 1000° C. for times from 30 to 120 min. Ultrasonic generator was utilized to develop standing ultrasonic waves in specimens during carburizing. Effect of ultrasonics depended on values of tensions evoked. At small intensities, carbon diffusion and thickness of cemented layer increased. At higher values of ultrasonic intensities, graphitization occurred during cementation. Some specimens ruptured in places of greatest tension and graphitization. 15 ref.

323-J.* **The Application of Rate Process Theory to the Heat Treatment of Titanium Alloys.** N. M. Erkun. *American Society for Metals, Transactions,* v. 51, Preprint no. 90, 1958, 16 p.

Time-temperature relationship applied to the heat treatment of 1-in. round bars of C-120AV (Ti-6Al-4V) and C-135AMo (Ti-7Al-4Mo) alloys. Using the rate process equation and considering only overaged portion of the aging curves, the constant C in the aging parameter T (C + log t) was found to be 15 for C-120AV and 20 for C-135AMo. By making use of the aging parameters, tensile properties, hardness and impact values of both alloys were plotted to show the relationship between mechanical properties and aging times and temperature at a constant solution treatment. 12 ref.
(J27d, Q-general; Ti-b)

324-J.* **Multiplying Factors for the Calculation of Hardenability of Hypereutectoid Steels Hardened From 1700° F.** C. F. Jatczak and D. J. Girardi. *American Society for Metals, Transactions,* v. 51, Preprint no. 99, 1958, 15 p.

Hardenability effects of Mn, Si, Cr, Ni, and Mo, singly and in combination, were studied in 1% C steels by the end quench test at a quenching temperature of 1700° F. and from normalized and spheroidized prior structures. Two different sets of hardenability factors were derived. One set, based on a normalized prior structure, can be used to predict the case hardenability of carburizing steel grades at carbon levels of 0.75 to 1.25%, and the other, based on a spheroidized prior structure, is for the hardenability prediction of homogeneous hypereutectoid analyses, such as toolsteels. Hardenability factors were obtained for each element to a level of 1.50% or higher with the exception of Mo whose effect was determined up to 1%. 11 ref.
(J5, 2-60; AY)

325-J.* Mechanized Austempering of Steel Harrow Disks. *Metal Progress,* v. 74, Sept. 1958, p. 78-80.

Parts are heated to 1575° F. in a neutral salt bath for 1.6 min., then austempered at 750° F. in a nitrate salt for 6 min. The bainitic structure obtained prevents directional cracking. (J26p, 18-74; ST)

326-J. (Russian.) **Suitable Conditions for Induction Hardening of Equipment Parts.** A. M. Shirokov and A. N. Zannes. *Stal',* v. 18, Aug. 1958, p. 730-736.

Installation for induction hardening with power of 100 kvt. and frequency of 2500 Hertz hardens working surface to a depth of 2-4 mm. Durability is increased on the average 2-3 times. (J2g; ST)

327-J. (Slovene.) **Effect of Carburizing the Exterior Surface on the Deformation Process of Steel.** M. Zumer and V. Prosenc. *Rudarsko-Metalurski Zbornik,* no. 4, 1956, p. 327-335.

Specimens machined from 0.07% C steel were normalized and then

carburized at different holding times and temperatures. Tensile strength increased with increase both in holding time and temperature, whereas elongation drops sharply. After carburizing at 920° C. for 50 min. the yield point disappears completely. The decrease in plasticity after carburization can be explained by assuming that the slip planes cannot reach the outer surface because the hard carburized layer prevents it. (J28g, Q-general; ST)

328-J. Bath, Shaker or Salt? Sampling Selects Best Carburizing Method. *Metalworking,* v. 14, Oct. 1958, p. 7-9.

Statistical sampling of results of various heat treating methods permits application of appropriate system. Part size, volume and determining factors. (J28g, S12j)

344-J. (Dutch.) **Quenching Oils Removed by Rinsing.** K. H. Kopietz and J. G. van Overvest. *Metalen*, v. 13, Aug. 15, 1958, p. 273-279.

Film of special oils can be rinsed with water in which it forms an emulsion. Carbon steel C15 test pieces quenched in different water emulsive oils showed clean surfaces after rinsing. (J26, W28p, L12e; CN)

345-J. (Czech.) **New Data on the Structure of Carbonitride Layers.** Josef Cadek. *Hutnicke Listy*, v. 12, no. 7, 1957, p. 597-604.

When the layer contains more than 0.5% N, microscopic porosities are formed, caused by the liberation of N in the form of molecular, nondiffusing N_2 from the atomic N in the austenite. Separation of N in molecular form, in turn, is related to the local thermodynamic activity of N on the grain boundaries, an activity connected not only with the N content, but also with the carbon concentration. (J28m; ST)

346-J.* (Russian.) **Characteristics of Tempering After Induction Hardening.** I. N. Kidin, E. V. Astaf'eva and A. N. Marshalkin. *Metallovedenie i Obrabotka Metallov*, v. 4, Sept. 1958, p. 2-12. (Henry Brutcher, Altadena, Calif., Translation no. 4348.)

Relationship between the procedure of high-frequency induction hardening and subsequent tempering; between the character of carbon distribution after hardening and its redistribution after tempering, which has a substantial effect on

mechanical properties of hardened and tempered steels. Tests conducted on steel 40KhN and 40KhG specimens hardened by continuous-successive method. After hardening, specimens were heated for 2 hr. at 200 to 650°. After heating to 500° specimens were tested on impact pendulum with 15 kg. power. Hardening with 1000° and tempering steel 40KhN results in same properties as in usual hardening and tempering. But hardening at 900°, with the same heating rate and tempering, results in maximum combination of properties—the impact rupture and hardness indexes are much higher. 16 ref.
(J29, J2g; ST)

347-J.* (Russian.) **Possibility of Raising Temperature of Solid Carburizer to 980°.** A. M. Tarasov and M. R. Semenchenko. *Metallovedenie i Obrabotka Metallov,* v. 4, Sept. 1958, p. 39-42. (Henry Brutcher, Altadena, Calif., Translation no. 4356.)

Investigation to study possibilities of increasing temperatures to raise productivity of carburizing process. The cementation temperature during the experiments was raised to 980° using steels 20KHGR, 20KHNM, 20KH and 20. Under conditions of repeated heating after quenching it is possible to recommend cementation of parts in solid carburizers at 980°. The quality of carburized layers is improved. As a result of cementation at 980°, the productivity of the process is increased by 40-50% as compared to cementation at 910°; by 15% as compared to 950° cementation.
(J28g; ST)

348-J.* **Potential of Higher Temperature Carburizing.** *Metal Progress,* v. 74, Oct. 1958, p. 134-139.

Manufacturers are becoming interested in carburizing at higher temperatures to increase production. First moves by heat treaters will probably be to the 1800 to 1850° F. range which will give carburizing rates about 50% higher than at 1700° F. Even higher temperatures may be used in the near future for thick cases on tractor gears and other heavy-duty equipment.

JOINING

1-K. Diffusion Bonding of Zircaloy to Stainless Steel Tubing. K. M. Gerken. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-JMG-10, May 29, 1957, 14 p. (CMA)

Diffusion bonded joints did not fail after thermal cycling 200 times in the 100-600° F. range or after pressure cycling 100 times in the 100-3900 psi. range. Hydraulic bursting pressures to 13,200-17,200 psi. were needed to cause failure in well-bonded joints. The tapered butt joint design is recommended.
(K5k; Zr, SS, 4-60)

2-K. Welding of Titanium and Titanium Alloys Containing Boron. Final Report. J. M. Gerkin. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-M-JMG-1, July 17, 1956, 7 p. (CMA)

For all of the Ti-B and Ti-Al-V-B alloys studied the hardness of the heat affected and weld zones was greater than that of the unwelded plate, while the ductility of the weld zones could be restored to its former level. The Ti-Al-V-B alloys have more ductility and much more strength than the Ti-B alloys for comparable contents of boron. 3 ref.
(K general, Q27a, Q29n, 2-60; Ti, *B*)

3-K. Joining of Molybdenum. W. N. Platte. Wright Air Development Center, Technical Report 54-17. *U. S. Office of Technical Services,* PB 128527, Aug. 1954, 108 p. (CMA)

Welds in deoxidized arc-cast molybdenum are subject to hot short cracking when the oxygen content of the argon atmosphere around the arc exceeds 0.2%, and the ductility of the welds is reduced drastically by the presence of more than 0.05% oxygen. Oxygen in sintered molybdenum produces porosity and hot short cracking, but good welds have been obtained by using deoxidizing agents. (K1d; Mo, 9-72)

4-K. Welding of Type 347 Steels. Arthur Hoerl and Thomas J. Moore. *Welding Journal,* v. 36, Oct. 1957, p. 442s-448s.

Statistical analysis of effects of various elements on crack sensitivity of fully austenitic Type-347 welds. 12 ref. (K9r, 2-60, 9-72; SS)

5-K. Mechanism of Microcracking in Mild-Steel Welding. K. Winterton. *Welding Journal,* v. 36, Oct. 1957, p. 449s-456s.

Theory in terms of the accumulation of hydrogen under pressure in pre-existent flaws, specifically incipient hot cracks and misfits at the boundaries of nonmetallic inclusions. 19 ref. (K9, Ni; CN, 9-72)

6-K. High-Temperature Brazing of Aluminum Bronze to Inconel. Donald Caplan and Ernest F. Nippes. *Welding Journal,* v. 36, Oct. 1957, p. 457s-464s.

Brazing aluminum bronze without flux; and alternately brazing with suitable fluxes based on mixed chlorides soluble enough to be readily removed. 29 ref.
(K8, 2-62; Cu-s, *Al,* Ni)

7-K. Thermal Analysis of Brazing and Hard-Surfacing Alloys—a Proposed Method. Forbes M. Miller. *Welding Journal,* v. 36, Oct. 1957, p. 986-991.

Simple, practical and accurate means for determining liquidus and solidus temperatures for brazing and hard surfacing alloys which melt within the range of 1600 to 2100° F. (K9; SGA-f)

8-K. Zinc Soldering of Aluminum. I. B. Robinson. *Welding Journal,* v. 36, Oct. 1957, p. 992-997.

Zinc soldering with the proper fluxes, solder and procedures provides simple method for joining aluminum to itself and dissimilar metals at intermediate temperatures to provide strong, easy-to-make, corrosion resistant joints. 4 ref.
(K7; Al)

9-K. (German.) **Modern Welding.** A. Hohmann. *Giesserei-Praxis,* v. 75, Sept. 30, 1957, p. 409-413.

Hot, cold and low heat processes; welding methods for gray cast iron, cast steel and malleable cast iron. Advantages of cast-weld construction. (K general; ST, CI)

10-K. (German.) **Safety of Welded Construction.** A. Slattenschek. *Schweisstechnik,* v. 11, Aug. 1957, p. 85-93.

Calculation of stress-strain; laboratory testing; unsafe conditions in welded construction; safety measures. 21 ref.
(K general, A7; ST, SGB-s)

11-K. Report on Strength of Welded Joints in Carbon Steel at Elevated Temperatures. Special Task Group of the Petroleum and Chemical Panel of Joint ASTM-ASME Research Committee. *ASME Transactions,* Paper no. 57-PET-1, 1957, p. 1-12.

Evaluation of strength of composite specimens including weld, heat affected metal and base metal, exclusive of any effects of mechanical notches, reinforcement, flaws, undercuts, etc. Material tested was silicon-killed carbon-steel plate.
(K9r, 2-62; CN, 4-53)

12-K. Problems of Arc Welding Heavy Steel Objects. A. Lüthy and A. Schmid. *Brown Boveri Review,* v. 44, June-July 1957, p. 260-270.

Edge preparation, welding technique, electrode selection, post-welding heat treatment, testing of seams.
(K1, K9q, K9r; ST)

13-K. Function of Fluxes in Automatic Arc Welding. A. L. Saboz and C. G. Telschow. *Brown Boveri Review,* v. 44, June-July 1957, p. 286-290.

Drawbacks encountered when welding with bare wire electrodes; function of welding fluxes used for automatic arc welding; differences between premelted and agglomerated fluxes; effect of fluxes on the welding process. (K1; RM-q)

14-K. Microcracking in Mild Steel Weld Metal. Pt. 1. K. Winterton. *Canadian Metalworking,* v. 20, Sept. 1957, p. 34-42.

Relationship between cooling rate, plate temperature, hydrogen content, hydrogen diffusion rate, nonmetallic inclusions and microcracking with 15 common electrodes. (To be concluded.)
(K9, W29h, 1-52; CN, 9-72)

15-K. Joining Mild Steel? How to Select the Right Electrode. C. Cambell. *Canadian Metalworking,* v. 20, Sept. 1957, p. 48-54.

Classification of joints and selection of electrodes.
(K1, W29h, 1-52; CN)

16-K. Process That Speeds a Quality Weld. *Design Engineering,* v. 3, Oct. 1957, p. 59-61.

Advantages, limitations, recommended conditions for use of "Aircomatic" process in welding mild steel; examples of use. (K1d; CN)

19-K. Butt Welding Austenitic Stainless Steel to Ferritic Steel in Cylindrical Shapes. J. E. Donahue. *Welding Journal,* v. 36, Nov. 1957, p. 1074-1077.

Used in turbine-generator units. 6 ref. (K1; SS-d, SS-e)

20-K. (Czech.) **Weldability at High Temperatures of Austenitic Nickel-Chromium Steel Stabilized With Columbium.** Josef Nemec. *Hutnické Listy,* v. 12, Sept. 1957, p. 788-794.

Weld failures with thick-walled elements attributed to the influence of heat on material adjacent to the weld. Brittle sigma phase and segregations on the boundaries of austenitic grains have unfavorable influences. 13 ref.
(K9s; SS, *Cb, Ni, Cr*)

21-K. (German.) **Strength of Bonded Metal Joints.** H. Winter and G. Krause. *Aluminium,* v. 33, Oct. 1957, p. 669-680.

61 ref. (K12)

22-K. (German.) **Reverse Twist in the Production of Wire Cables.** Josef

Regensburger. *Draht,* v. 8, Aug. 1957, p. 285-289.

To avoid unbalance of stresses on individual wires in a cable, a reverse motion of the individual wire is required in relation to the stranding motion. Variable crank mechanisms, planetary gears or Leonard drives are used to generate this motion. (K13a)

23-K. (German.) **Weaving of Heavy Wire Cloth.** A. Jasper. *Draht,* v. 8, Aug. 1957, p. 296-298.

Woof wires must be crimped when the longitudinal force along the warp wire is higher than the maximum force exerted by the weaving frame of the loom. Computations for determining the forces. (K13s; 4-61)

24-K. (German.) **Structural Defects of Austenitic Welds on Ferritic Steels Subjected to Elevated Temperatures.** Friedrich Erdmann-Jesnitzer, Manfred Beckert and Heinz Schmiedel. *Schweissen und Schneiden,* v. 9, Sept. 1957, p. 407-414.

Welding of ferritic steels with austenitic electrodes leads to the formation of a decarburized alpha iron zone close to the weld. This is particularly susceptible to stress-corrosion cracking. Formation of alpha-iron zone of the columnar grain type can be suppressed by suitable carbide-forming additions. Testing apparatus to determine the relation between depth of decarburization and time until fracture. 50 ref. (K1, K9n; ST, 9-72)

25-K. (German.) **Metallurgical Aspects of Welding Heat Resistant 12% Cr + Mo-V-W Alloy Steels.** E. Kauhausen and P. Kaesmacher. *Schweissen und Schneiden,* v. 9, Sept. 1957, p. 414-419.

In the temperature range around 580° C., 12% Cr steel is satisfactory for high-pressure tubes and turbines. Welding can be done under carefully selected conditions. Recommendations for welding procedures with seven different coated electrodes. (K1; SS, SGA-h)

26-K. (German.) **Problems of the Technique of Welding.** Erich Sudasch. *Werkstatt und Betrieb,* v. 90, Oct. 1957, p. 745-753.

Review of papers given at German Welding Engineering Society meeting. (K general)

27-K. (Japanese.) **Consumption of Aluminum, Iron and Copper Welding Electrodes in Air, Argon and Carbon Dioxide.** M. Ozawa, T. Morita and K. Omura. *Electrochemical Laboratory, Bulletin (Denki Shikenja Iho),* v. 21, July 1957, p. 512-517.

Effects of oxygen and oxides; effect of iron oxides on steel; effect of copper oxide on copper; effect of alumina on aluminum. (K1, W29h; ST, Cu, Al)

28-K. (Russian.) **Mechanics of the Development of Hot Cracks in Weld Joints.** V. A. Toropov. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 54-58. (Also *Henry Brutcher Translation* No. 3982.)

Theoretical consideration of intercrystalline relationships. 13 ref. (K9n, 9-72)

29-K. (Russian.) **Electroslag Welding Using Magneto-Propelled Apparatus.** M. M. Fikshis. *Stanki i Instrument,* v. 28, Aug. 1957, p. 29-32.

Apparatus suitable for welding of angle joints of any design. Use of one apparatus on each side of the welded part simultaneously is recommended. 9 ref. (K1e, 1-52)

30-K. **Squirt Gun Welds Dissimilar Metals.** A. R. Kemerer. *American Machinist,* v. 101, Oct. 21, 1957, p. 146-147.

Heavy sections of T-1 steel and 405 stainless welded by semi-automatic submerged arc with 18-8 stainless steel wire and Cr-enriched flux. (K1e; ST, SS)

31-K.* **Welding of Uranium.** J. R. C. Gough and D. Roberts. *British Welding Journal,* v. 4, Sept. 1957, p. 393-403.

Investigation to assess adaptability of argon arc, metal arc and resistance spot welding processes to joining of U. Chemical and physical properties of U and their effect on welding. 18 ref. (K1, K3n; U)

32-K. **Welding of Heat-Exchanger Elements in a Fast Breeder Reactor.** S. H. Griffiths. *British Welding Journal,* v. 4, Sept. 1957, p. 403-411.

Argon arc welding process and radiographic and other inspection methods used in fabrication of heat exchangers from 18-8-1 stainless steel. (K1d, W13b, S13k)

33-K.* **Weldability of ND Steels.** L. Reeve. *British Welding Journal,* v. 4, Sept. 1957, p. 425-432.

Battelle and Reeve underbead cracking tests for weldability carried out on series of C-Mn steels including a number of notch ductile types. Results more in accord-

ance with British carbon equivalent formula than Battelle formula for weldability. 7 ref. (K9s; AY)

34-K.* Shielded Inert-Gas Metal-Arc Welding With Particular Reference to Welding Costs. D. B. Tait. *British Welding Journal,* v. 4, Nov. 1957, p. 501-511.

Application of "sigma" process to Al alloys, stainless steel and mild steel. (K1d; Al, SS, CN)

35-K. Induction Brazing. W. E. Benninghoff. *Industry and Welding,* v. 30, Sept. 1957, p. 36-38, 64-67.

Principles and advantages of induction brazing, joint design, heating and alloy selection. (K8k)

36-K. It's Not So Tough to Weld Copper and Steel. *Industry and Welding,* v. 30, Sept. 1957, p. 53, 77.

Carbon-arc and phosphor-bronze welding rods used for welding mild steel legs to copper vessels. (K1h; Cu, ST)

37-K. No Threads, No Welds, Just Glue. Jack Schwartz. *Metalworking Production,* v. 101, Nov. 8, 1957, p. 2006-2007.

Epoxy resin ensures high joint strength in armor-piercing shot. (K12; NMd34; AY)

38-K. Copper Brazing. Thomas W. Ferguson, Jr. *Metal Treating,* v. 8, Sept-Oct. 1957, p. 6-7, 40, 44, 55.

The process, its advantages, preparation, assembling, applying brazed material, controlling Cu flow, atmosphere for furnace brazing, strength of joints and heat treatment of Cu brazed steel assemblies. (K8; ST, Cu)

39-K.* New CO_2 Welding Process. A. F. Chouinard and R. P. Monroe. *Welding Journal,* v. 36, Nov. 1957, p. 1069-1073.

Uses a bare flux-cored electrode and gives a high deposition rate, a visible arc and sound weld metal; suitable for welding low to medium-carbon steels and certain alloy steels. (K1d; ST)

40-K.* Bonded Fluxes for Submerged-Arc Welding of Alloy Steels. Hallock C. Campbell and Wallace C. Johnson. *Welding Journal,* v. 36, Nov. 1957, p. 1078-1084.

New type flux permits controlled variation of weld chemistry through incorporation in the flux of alloying elements, deoxidizers and strong fluxing agents, duplicating for submerged arc welding the whole range of formulation used by the covered-electrode manufactures. (K1e; SS, RM-q)

41-K.* Experimental Welding With the Cone Arc. R. E. Monroe and D. C. Martin. *Welding Journal,* v. 36, Dec. 1957, p. 518s-520s.

Electrical characteristics of the cone-arc welding process studied during development of welded Mo heat exchangers containing tube-to-header joints. Tests showed that the production of uniform welds was primarily a function of even heat transfer around the weld periphery. High-speed motion-picture studies of the arc failed to substantiate the basic cone-arc theory of a rotating ion beam. A modified theory is presented to explain the cone-arc process. 4 ref. (K1; Mo)

42-K.* Selection of Welding-Rod Chemical Composition Through Mathematics. G. H. Bohn. *Welding Journal,* v. 36, Dec. 1957, p. 541s-549s.

Procedure for determining the most satisfactory chemical composition for Cu-Si-Mn-Fe alloy welding rod. A mathematical formula was developed to determine the minimum resultant tensile strength of the weld as a function of the Si, Mn and Fe contents. The desired fluidity of the weld pool, to eliminate weld cracking, was obtained by maintaining the ratio of Si to Mn to an experimentally determined minimum. 6 ref. (K1, W29h, 2-60)

43-K.* Heat-Exchanger Fabrication. P. Patriarca, G. M. Slaughter and W. D. Manly. *Welding Journal,* v. 36, Dec. 1957, p. 1172-1178.

Tube-to-tube sheet welding and brazing procedures which have been incorporated into the fabrication of Ni-alloy heat exchangers for elevated-temperature service. Vessel portions of these units are assembled entirely by inert-arc welding procedures. (K1d, W13b; Ni)

44-K. A Satisfactory Base-Quality Steel for Both Riveted and Welded Structures. J. O. Jackson. *Welding Journal,* v. 36, Dec. 1957, p. 1184-1194.

Argues that specification ASTM A7 be revised to indicate that it is suitable for use in either riveted or welded structures, allowing the specified 60,000-psi. minimum tensile strength to remain, but adding a carbon limitation of 0.30% on ladle analysis up to a maximum permissible thickness for welded structures of 2 in. (K1, 15-68; ST)

45-K. Fluid-Cooled Honeycomb: Special Furnaces, Core Machinery Fabricate Brazed. *Western Metals,* v. 15, Nov. 1957, p. 50-51.

68-K. (Spanish.) **Factors in Productivity of Welding.** Othmar Schmidt. *Ciencia y Tecnica de la Soldadura,* v. 7, Sept-Oct. 1957, 7 p.

Factors influencing productivity of manual electric arc welding in plant where specialty is not welded construction but certain types of machinery. Knowledge of steels, electrodes, welding apparatus, preparation of work, design, tools, contraction phenomena. (K1; ST)

69-K. (Spanish.) **Assembly of Motorcycle Frames: Several Solutions to This Problem.** Ernest Demaret. *Ciencia y Tecnica de la Soldadura,* Sept-Oct. 1957, 9 p.

Welding techniques applicable to manufacture of two-wheel vehicles and specific uses of each. 12 ref. (K general, T10h; ST)

70-K. (Spanish.) **Influence of Welding on Metal Structures.** C. Penche Felgueroso. *Ciencia y Tecnica de la Soldadura,* v. 7, Sept-Oct. 1957, 12 p.

Advantages of metal structures over concrete, and of welded joints over other types. Three types of structures, isostatic, rigid and semi-rigid, considered, from point of view of stress and load factors, as well as design factors, convenience of execution of joints, etc.; examples. (K general, T26)

71-K. Science and Technique of Welding in the Soviet Union. N. N.

Rykalin. *British Welding Journal,* v. 4, Dec. 1957, p. 541-547.

Submerged-arc welding is most commonly used, and a wide variety of equipment has been developed. Electro-slag process for the single-pass welding of thick plates or slabs. Widespread use of alternating current for welding in the U.S.S.R. 7 ref. (K general)

72-K.* Projection Welding of 24 S.W.G. Mild Steel. J. E. Roberts and G. A. Phipps. *British Welding Journal,* v. 4, Dec. 1957, p. 557-563.

Experimental technique used to determine optimum welding conditions for single, double and triple projection welds. Selection of the welding conditions has been made by the examination of mean strength, consistency and surface appearance. 4 ref. (K3q; CN)

73-K. (Italian.) A Case of Improper Welding. Eugenio Hugony. *Ingegneria Meccanica,* v. 6, Sept. 1957, p. 7-8.

Analysis of fragment of turbine blade in 18-8 stainless showed that defective casting has been repaired with inferior materials and improper welding procedures, resulting in fracture of part during service. (K general, 18-72; SS, 5-60)

74-K. (Russian.) Dispersion of Carbon in the Vicinity of Welded Joints of Austenitic Steel Type 18-9. N. V. Ulyanova and V. V. Sagalovich. *Metallovedenie i Obrabotka Metallov,* no. 7, July 1957, p. 2-7.

The carbon was traced by radioactive isotopes. Images produced by auto-radiography proved to be satisfactory for evaluating the macroscopic character of carbon dispersion in the welded joint and in the adjoining areas in this Cr-Ni Steel. 4 ref. (K9r, 1-59; SS)

75-K. Stainless Steels: Problem or Opportunity? H. J. Nichols. *Canadian Metalworking,* v. 20, Oct. 1957, p. 50-52.

Classes of stainless steels and difficulties encountered in welding. (K general; SS)

76-K. Microcracking in Mild Steel Weld Metal. Pt. 2. *Canadian Metalworking,* v. 20, Oct. 1957, p. 58-64.

Relationship between electrode type, hydrogen content, hardness and microcracking density. Association of microcracking with different types of nonmetallic inclusions and hydrogen accumulation in flaws. 19 ref. (K1, 9-72; CN)

77-K.* Dip Brazing Magnesium. William J. Graves. *Light Metal Age,* v. 15, Dec. 1957, p. 23.

Two parent material alloys of magnesium have been successfully brazed, M1A alloy and AZ31B (FSI) alloy. The most satisfactory brazing filler alloy to date is AB125. Dow brazing flux #452 has given the best results with this filler alloy. (K8n; Mg, SGA-f)

78-K. Welding the Lincoln Uniframe Body. M. H. Trygar and O. B. Simmons. *Machinery,* v. 64, Dec. 1957, p. 162-165.

Spot welding process. (K3n)

79-K.* Joining of Metals. *Metal Industry,* v. 91, Dec. 13, 1957, p. 495-497.

Resumé of four papers on wetting and spreading of liquid metals on solid metal surfaces which were presented recently at a conference at University of Birmingham, England. (K9n)

80-K. Automatic Multi-Stage Projection Welding Line. E. C. Hall. *Metalworking Production,* v. 101, Nov. 1, 1957, p. 1951-1955.

Automatic feeding systems for multiple resistant welding stations. (K3q, 1-52, 18-74)

81-K. Challenge to the Rubber Industry. Ralph Schmuckal. *Rubber Age,* v. 82, Dec. 1957, p. 478-480.

Problems involved in bonding of rubber to metal and subsequent serviceability of metal-rubber parts. (K11c)

82-K. Trends in Metal Preparation. F. W. Gage. *Rubber Age,* v. 82, Dec. 1957, p. 480-481.

Pretreatment of metal surfaces preparatory to bonding of rubber coatings. (K11c, L10c, L12n)

83-K. Trends in Rubber-to-Metal Bonding. Howard L. Irvin. *Rubber Age,* v. 82, Dec. 1957, p. 481-482.

Present types and future requirements of adhesives and elastomers, with special reference to bonded assemblies intended for high-service temperatures. (K11c; NM-d36)

84-K. Application of Ultrasonic Energy to Cold Welding of Metals. J. B. Jones and C. F. DePrisco. Aeroprojects Inc. (Frankford Arsenal.) *U. S. Office of Technical Services,* PB 131083, Nov. 1953, 61 p. $1.75.

(K6, 1-74; EG-a38)

85-K. Ultrasonic Welding of Metals. J. B. Jones, C. F. DePrisco and J. G. Thomas. Aeroprojects Inc. (Frank-

ford Arsenal.) *U. S. Office of Technical Services,* PB 131084, Apr. 1955, 105 p. $2.75.

(K6, 1-74)

86-K. Evaluation of Welded Joints Between AISI 347 Stainless Steel and 70-30 Copper-Nickel Alloy Tubes Under Thermal Shock Specimen No. 3. W. E. Clautice and R. W. Stevens. U. S. Naval Engineering Experiment Station. *U. S. Office of Technical Services.* PB 121877, May 1955, 49 p. $1.25.

Evaluation of emergency heat exchangers in a new type of submarine propulsion plant.
(K9r, Q10a, W13b; SS, Cu, Ni)

87-K. Strength and Corrosion Resistance of Ultrasonically Soldered Aluminum Joints. J. B. Jones and J. G. Thomas. Aeroprojects Inc. (Frankford Arsenal.) *U. S. Office of Technical Services,* PB 121965, Mar. 1956, 61 p. $1.75.

(K7h, Q27a, R general: Al, Sn, Cd)

88-K.* Study of Metallurgical Effects in the Multipass Welding of Zircaloy. *Welding Journal,* v. 37, Jan. 1958, p. 1s-9s.

Tests on a 32-pass weldment indicate that 100% joint efficiency was achieved with very slight loss of ductility through proper control of interpass temperature. The corrosion behavior of the weldment is equivalent to, or better than, that of the base metal. 12 ref.
(K9n, R general; Zr)

89-K. Development of Welding for Engineering Fabrication. J. H. Humberstone. *Welding Journal,* v. 37, Jan. 1958, p. 9-15.

History, applications and recent developments. (K general, A2, 17-57)

90-K. New Techniques in Precision-Welding Control. J. L. Solomon and M. Balikov. *Welding Journal,* v. 37, Jan. 1958, p. 16-21.

Control of function duration by counting cycles rather than timing by the use of resistance-capacity circuits. (K3)

91-K.* Effect of Preheating and Postheating on Toughness of Weld Metal. T. N. Armstrong and W. L. Warner. *Welding Journal,* v. 37, Jan. 1958, p. 27s-29s.

Postheating weld metal from seven classes of steel electrodes at 1150° F. in no instance lowered the transition temperature. Preheating at temperatures up to 600° F. improved the impact properties of E7015 carbon steel weld metal and E8015-C2 nickel steel weld metal. In no instance did preheating adversely affect the impact properties of welds from these two electrodes.
(K9p, K9q, Q6n; ST)

92-K.* Dip Brazing Aluminum With Paste Filler. A. M. Setapen. *Welding Engineer,* v. 43, Jan. 1958, p. 30-32.

New filler metal is a eutectic consisting of 88% Al and 12% Si (AWS designation BAlSi-4), and melts between 1070-1080° F. Supplied as a powder in combination with a controlled amount of a flux-cement, it is made up into an aqueous paste, coated directly onto the joint area.
(K8n; SGA-f, Al)

93-K.* Application Aids for Arc Welding Aluminum Bus. *Welding Engineer,* v. 43, Jan. 1958, p. 34-37.

Recommended practices for metal-arc welding with flux-coated electrodes; recommended practices for Tig welding aluminum; typical properties of Tig and Mig welds in aluminum bus conductor.
(K1e, T1c; Al)

94-K. Filler Metals for Joining. Orville T. Barnett. *Welding Engineer,* v. 43, Jan. 1958, p. 56-62.

Classifications, specifications, applications and properties.
(K1, S22; SGA-f)

95-K. Primary Structure and Causes of Weld Hot Cracking of Chromansil-Type Steel. S. V. Avakyan and N. F. Lashko. *Avtogennoe Delo,* v. 21, no. 10, 1950, p. 13-16. (Henry Brutcher Translation no. 3983, Altadena, Calif.)

Previously abstracted from original. See item 111-K, 1951.
(K1, M21, AY)

96-K. (Dutch.) **Silver Soldered Heating Coils in Crude Oil Tankers.** H. R. Brooker. *Lastechniek,* v. 23, Oct. 1957, p. 236-239.

For a long time fusion welded steel pipes were used as heating coils, but because of severe corrosion, the life-span was short. Aluminum-bronze pipe (76-22-2), although much higher in price, means a considerable saving to the ship owner. Silver soldering was chosen as the best joining method. Advantages include reliable joints between different metals, ability to join special Cu alloys with a strength equal to that of the parent metal, working speed and economy.
(K7; *Ag, Cu, Al*)

97-K. (Dutch.) **Manufacture of Pipelines for High Pressure and Temperature.** W. J. Kaufman. *Lastechniek,* v. 23, Oct. 1957, p. 239-242.

Increasing pressures and temperatures lead to higher percentages of alloying elements and greater thicknesses of the walls. Both factors result in higher accuracy requirements. Principal manufacturing methods, beginning with bending. Data on welding problems, subdivided into fusion, arc and inert arc. (K1, T26r, 2-62, 3-74; AY)

98-K. (Dutch.) **Production in the Welding of Pipelines.** A. J. van der Velde. *Lastechniek,* v. 23, Oct. 1957, p. 243-246.

Experience in arc welding of pipelines of unalloyed steel. Advantages and disadvantages of various methods. Speed and quality, cost and production figures. 16 ref.
(K1, T26r; ST)

99-K. (Dutch.) **Welding of Boiler Tubes.** C. Nederveen. *Lastechniek,* v. 23, Oct. 1957, p. 251-253.

Excellent results are obtained on boiler tubes 2 to 6 in. diameter of unalloyed and low-alloy steel by welding the basic seam with argon-arc and filling with coated electrodes. (K1a, K1d, 4-60; ST)

100-K. (Dutch.) **Fusion Welding in the Installation of Pipelines.** H. Jansen. *Lastechniek,* v. 23, Oct. 1957, p. 254-260.

Survey of pipe joining methods without details on pipe construction. Use of welding in pipelines and its advantages explained by example. The safety of a pipeline requires, next to the selection of the right material, a suitable form of welding, the hiring of skilled welders and thorough checking of the welds. Welding has been found to be the most modern and advantageous method. 7 ref.
(K general, T26r; ST)

101-K. (Dutch.) **Welding of Thin-Walled Tubes in the Construction of Airplanes.** N. Groenendijk. *Lastechniek,* v. 23, Oct. 1957, p. 261-264.

Materials for seamless drawn tube; welding; shrinking of the material in welding. Welding methods—fusion arc, argon-arc, brazing. Welding of light alloys; welding of Cu and Cu alloys.
(K1, K8; EG-a39, Cu, 4-60)

102-K. (Dutch.) **The "Boxed" Welding of Rails.** G. Zoethout. *Lastechniek,* v. 23, Nov. 1957, p. 274-277.

For welding on the roadbed a new process named "boxed-in" welding uses a special basic electrode (Philips 250R). The essential feature is the great supply of heat, which has a favorable influence upon the weldability of rail.
(K1; T23q; ST)

103-K. (German.) **Welding in Railroad Car and Diesel Construction.** Karl Mesnaritsch. *Schweisstechnik,* v. 11, Oct. 1957, p. 109-116.

Examples of versatility of epoxyd-resin in applications in vacuum technique, electrotechnics, optics and supersonics. (K12, NM-d34)

131-K. (German.) **Warping of Cylindrical Structures by Internal Stresses Caused by Welding.** F. W. Bornscheuer. *Schweissen und Schneiden,* v. 9, Nov. 1957, p. 492-494.

5 ref. (K general, Q25h, 7-51)

132-K. (German.) **Welding in the Vacuum Technique.** Werner Espe. *Vakuum-Technik,* v. 6, Aug. 1957, p. 91-98.

Examination of welding methods tested and approved in the high-vacuum technique, especially in fabrication of high-vacuum and gas-discharge tubes. (To be continued.) (K general, 1-73)

133-K. (Italian.) **Applications of Resistance Welding.** Oscar Grossi. *Macchine,* v. 12, Nov. 1957, p. 1057-1069.

Applications, techniques in fields of automotive vehicles, bicycles, motorcycles, electrical equipment, lightweight boiler elements, railroad equipment, steel industry, with numerous illustrations of equipment for specific jobs. (K3)

134-K.* (French.) **Applications of Welding in the Construction of Stainless Steel Railway Cars.** M. Thomas. *Soudage et Techniques Connexes,* v. 11, Nov-Dec. 1957, p. 345-351.

Because of its physical and mechanical properties, 18-8 type stainless is no more costly for railway car construction than ordinary steel and permits saving of 33% in weight. Sub-assemblies are prepared from bent and drawn components, welded mainly by spot, seam and double-spot welding processes. Details of equipment, fabricating principles. (K3n, T23p, 17-57; SS)

135-K.* (French.) **Some Resistance Welding Applications in the Field of Metal Framework Construction.** J. M. Labessoulhe. *Soudage et Techniques Connexes,* v. 11, Nov-Dec. 1957, p. 356-367.

Principles, advantages of spot welding; welding machines capable of assembling on an industrial basis two thicknesses of 25 mm., or three thicknesses of 20 mm.; examples of light-weight frame structures. (K3n; ST, SGB-s)

136-K.* (French.) **Metallurgy of Welding Certain Austenitic Heat and Corrosion Resistant Alloys.** Anthony H. Waterfield and Russel P. Culbertson. *Soudage et Techniques Connexes,* v. 11, Nov-Dec. 1957, p. 373-380.

Metallurgical properties of three corrosion resistant alloys (Ni-Mo, Ni-Mo-Cr, Ni-Mo-Cr-Fe) and three heat resistant alloys (Ni-155, Co-W-Ni-Cr, Ni-Cr-Mo-Fe) in light of their effect on welding techniques required. Methods available for stainless steel can be used provided proper precautions are observed. (K general, K9; SS, SGA-g, SGA-h)

137-K. (French.) **Welded Framework for G2 and G3 Nuclear Reactors at Marcoule.** J. Doat. *Soudage et Techniques Connexes,* v. 11, Nov-Dec. 1957, p. 391-396.

Framework of two buildings, each housing one reactor, consists of six box-shaped, articulated portal frames fabricated from 37/44 openhearth steel plate welded by semi-automatic submerged arc techniques. Details of shop and site work. (K1e, W11p, 17-57; ST, 4-53)

138-K. (German.) **On the Evaluation of Defective Welds Through X-Ray Examination and Fatigue Tests.** Hermann Möller and Max Hempel. *Archiv für das Eisenhüttenwesen,* v. 28, Sept. 1957, p. 531-541.

Results of fatigue tests compared to those from perfect welds. Porous welds, welds with slag enclosures and with stringer-type structures in the sheet metal showed the same fatigue properties as the specimens with perfect welds. Thus minor internal defects are negligible in acceptability criteria for welds. This contradicts common practice. Only defects in the boundary between workpiece and weld are of serious consequence. 13 ref. (K9r, Q7a; ST, 9-69)

139-K. (German.) **Pressure Welding at Low Temperature.** H. Jacob. *Fertigungstechnik,* v. 7, Sept. 1957, p. 393-399.

Conditions for perfect pressure welding of various metals; factors in aluminum welding. Examples of applications. Influence of deformation velocity, formation of oxide layers, surface deformation, surface roughness and temperature upon the strength of the weld. 27 ref. (K5, 2-63, K9)

140-K.* **Dip Brazing Aluminum With Paste Filler Metal.** *Canadian Metalworking,* v. 21, Jan. 1958, p. 38, 40, 42, 44, 46.

Alumibraze is an Al-Si filler metal consisting of 88% Al and 12% Si (AWS designation BAlSi-4), and melts between 1070 and 1080° F. Alumibraze has been used with more than a dozen wrought alloys including types EC, 1100, 3003, 5050, 5052, 5056, 5254, 6053, 6061, 6062, 6063, 6066, X2219 and X5356, as well as several cast alloys. 144-K. Welding Stainless Steels. R. E. Paret. *Machinery,* v. 91, Nov. 8, 1957, p. 1095-1102.

(K general; SS)

145-K. Why Product Manufacturers Are Switching to Stitching. Kim Darby. *Modern Metals,* v. 13, Nov. 1957, p. 48-51.

Metal stitching or stapling speeds fabricating and assembling for variety of metal parts. (K13)

146-K.* **Something New in Joining Nonferrous Metals.** *Modern Metals,* v. 13, Nov. 1957, p. 70, 72.

Process employing complex chloride compound can join almost all nonferrous metals to each other except alloys high in Ni or Si. Joining takes place at temperatures below melting point of either metal. Electrical and mechanical properties of joint are similar to base metal properties. (K6, EG-a38)

147-K. Welding Rod Trends. R. K. Lee. *Steel,* v. 141, Dec. 9, 1957, p. 180-186, 191.

Functions and advantages of welding electrodes with coatings containing Fe powder. (K1a, W29h)

148-K. How To Weld Copper and Its Alloys. Pt. 1. Lester F. Spencer. *Steel,* v. 142, Jan. 27, 1958, p. 86-89.

Of the six possible methods, properties desired in the joint will determine choice. Rules for the inert-gas metal-arc method given. (To be continued.) (K general, K1d; Cu)

149-K.* **Fabrication of Stainless Steel Honeycomb Sandwich Structures.** W. J. Lewis, G. E. Faulkner and P. J. Rieppel. *Tooling and Production,* v. 23, Jan. 1958, p. 73-77.

Welding and machining honeycomb core of 17-7PH stainless steel; fabrication of edge members, techniques in cleaning and brazing sandwich panels.
(K general, G17, K8; SS, 7-59)

150-K. Assembly of Electric Iron Components. L. G. Northfield. *Welding and Metal Fabrication,* v. 25, Oct. 1957, p. 394-396.

Spot welding operations in joining Ni-Cr strip to Ni-Ag leads and joining Ni-plated mild steel to Ni-Ag. (K3n, T10a; SGA-s, Ni, Cu, CN)

151-K.* **Inert-Gas Tungsten-Arc Welding SAE 4130 Steel Sheet. Pt. 1.** C. A. Terry and W. T. Tyler. *Welding and Metal Fabrication,* v. 25, Oct. 1957, p. 397-402.

Influence on weld porosity of sheet surface condition and microstructure, shielding gas impurities, surface of filler wire and inadequate shielding. Effect of cooling rate and welding speed on weld cracking. 10 ref.
(K1d, 3-67; AY, 4-30, 9-72)

152-K. Welding With Ultrasound. Thomas A. Dickinson. *Welding and Metal Fabrication,* v. 25, Oct. 1957, p. 403-404.

Ultrasonic sound energy utilized to weld fine wire and foil components of both similar and dissimilar materials including Cu, Al, brass and stainless steel alloys. A 2000-watt unit made spot and seam welds in metal parts with thicknesses from 0.002 to 0.050 in.
(K3n, K3p, 1-74; Al, Cu, Zn, SS)

153-K.* **Welds Made Between Some Wrought and Cast Aluminum Alloys,**

and Welds in Some Cast Aluminum Alloys. J. C. Bailey, J. A. Hirschfield and T. Horwood. *Welding and Metal Fabrication,* v. 25, Nov. 1957, p. 434-441.

Welding procedure and properties of welds made by tungsten-argon-arc and metal-arc welding processes between different combinations of wrought and cast Al alloys. Mechanical properties determined for combination of NS3, NS6, HS30, LM4-M, LM5-M and LM6-M alloys. (K1, Q general; Al)

154-K.* Inert-Gas Tungsten-Arc Welding SAE 4130 Steel Sheet. Pt. 2. C. A. Terry and W. T. Tyler. *Welding and Metal Fabrication,* v. 25, Nov. 1957, p. 442-448.

Effect of cooling rate, base metal microstructure and metal composition on incidence of transverse cracking in welds made in SAE 4130 steel sheet by argon-shielded tungsten-arc welding procedures. Carbide segregation in form of pearlite banding exerted strong influence on weld cracking. Severe external restraint and increasing carbon content increased extent of cracking. 4 ref.
(K1d; AY, 4-30, 9-72)

155-K. Flash-Butt Weld Procedures for Extruded Titanium Parts. R. N. Foster. *Welding Engineer,* v. 43, Feb. 1958, p. 29-30.

Material most commonly welded by the resistance flash-butt process is the 99% pure Ti grade defined in ASM 4921, although many rings have been welded with various Ti alloys (A 110 AT, 1 50 A, and C 120 AV).
(K3, Ti, 4-58)

156-K. Air Compressors in Welding Operations. *Welding Engineer,* v. 43, Feb. 1958, p. 42-43.

(K3, W29q)

157-K. Automatic Submerged-Arc Welders Prime Aids at Harvester. D. L. Hansen. *Welding Engineer,* v. 43, Feb. 1958, p. 62-64.

Procedure followed at International Harvester Co. in welding the box section C-frame, corresponding to tractor size, to which the bulldozer blade is fastened.
(K1e, T4; ST)

158-K.* Performance of Welds in Some Aluminum Alloys. Paul B. Dickerson. *Welding Journal,* v. 37, Feb. 1958, p. 107-113.

Inert-gas-shielded-arc welding has improved performance in Al welds. Strength and ductility of butt welds in various Al alloys, longitudinal and transverse shear strengths of fillet welds, effect of temperatures from −400 to 700° F. upon the tensile properties and resistance to corrosion of several of the high-strength weldable alloys. (K1d; Al)

159-K. Uses of Oxygen and Acetylene Gases in the Refrigerator Industry. Paul Bowman. *Welding Journal,* v. 37, Feb. 1958, p. 120-123.

Applied to welding, braze welding, Ag brazing, and soldering.
(K2, K6q, K7, K8, RM-g30, RM-g33)

160-K. Revised Welding Practices Pay Off in the Jet-Engine Industry. F. J. Bacon. *Welding Journal,* v. 37, Feb. 1958, p. 124-126.

Fit-up standards, basic cause and results of loose fits.
(K general, S22, T24b)

161-K.* Development of Filler Wires for Welding SAE 4130, 4140 and 4340 Steels. H. W. Mishler, R. P. Sopher and P. J. Rieppel. *Welding Journal,* v. 37, Feb. 1958, p. 41s-48s.

Filler wires for inert-gas tungsten-arc and inert-gas consumable-electrode welding of high-strength low-alloy aircraft steels. Weld-metal porosity, weld-metal cracking tendency, heat treatment, response as compared with the base materials, strength of heat treated weld joint and weld metal toughness. Two filler wires were developed for welding each steel. One of each pair of filler wires had a composition similar to the base material, while the other was of dissimilar composition. (K1d; W29h, AY)

162-K.* High-Vacuum Electron-Beam Fusion Welding. W. L. Wyman. *Welding Journal,* v. 37, Feb. 1958, p. 49s-53s.

New vacuum process consists of bombarding two pieces to be fusion welded with a beam of electrons in a high-vacuum chamber. Basic elements are a tungsten cathode to emit a large number of electrons; a high potential, several thousand volts between the cathode and plate to accelerate the electrons; a focusing system to form the electrons into a beam, a vacuum chamber and pumping equipment to maintain a pressure of 5×10^{-3} mm. of mercury. Work directed toward development of Zircaloy-2 welding procedures.
(K6, 1-73; Zr)

163-K.* Nature of High-Temperature Brazing Alloy-Base Metal Interface Reactions. W. Feduska. *Welding Journal,* v. 37, Feb. 1958, p. 62s-73s.

Microstructural and hardness characteristics analyzed at brazed joint interfaces, in the unaged, aged and superheated conditions of combinations of five types of high-temperature base metals and three types of high-temperature brazing alloys. 6 ref.
(K8, M27f, Q29n; SGA-h, SGA-f)

164-K.* Weldability of Notch-Ductile Steels. L. Reeve. *Welding Journal,* v. 37, Feb. 1958, p. 74s-80s.

Weldability tests on a series of C-Mn steels, including a number of ND (notch-ductile) steels supplied in accordance with the new British Standard Specification 2762 (1956) for notch-ductile steels. CTS and Battelle cracking tests have been used. 7 ref.
(K9s, 1-54 ,CN)

165-K. (German.) **Welding and Cutting Aluminum With Rare Gas Shielded Electrodes.** W. Mantel and L. Wolff. *Aluminium,* v. 34, Jan. 1958, p. 36-40.

(K1d, G22h; Al)

166-K. (German.) **Influence of Gases in Arc Welding of Steel.** J. D. Fast. *Schweissen und Schneiden,* v. 9, Dec. 1957, p. 512-517.

Interaction between gas and liquid weld metal; formation of blowholes; aging phenomena and brittleness. 20 ref.
(K1, K9n, 9-68; ST)

167-K. (German.) **Influence of Hydrogen on the Properties of Welds.** P. C. van der Willigen. *Schweissen und Schneiden,* v. 9, Dec. 1957, p. 517-521.

15 ref. (K general, 9-72; H)

168-K. (German.) **Metallurgical Reactions Between Brazing Alloys and Base Materials.** Johanes Schatz. *Schweissen und Schneiden,* v. 9, Dec. 1957, p. 522-530.

Thermodynamic considerations in designing for brazing. 29 ref.
(K8, 17-51; SGA-f)

169-K. (Spanish.) **National Welding Contests.** I. Semprun. *Ciencia y Tecnica de la Soldadura,* v. 7, Nov-Dec. 1957, 4 p.

Sixth and seventh national contests in oxy-acetylene and electric welding sponsored by Welding Institute of Spain to advance interest in techniques and standards of performance; results showed that many shops still do not have adequate training and inspection programs.
(K general, A5d, A6m)

170-K. (Spanish.) **Planning of Welded Structures to Increase Productivity.** G. Repeczky. *Ciencia y Tecnica de la Soldadura,* v. 7, Nov-Dec. 1957, 14 p.

Pre-planning and coordination of design, welding methods, equipment, materials handling; time and cost estimates; responsibility of personnel in each area.
(K general, A4s, A5; SGB-s)

171-K. (Spanish.) **Welding Productivity in Japanese Naval Construction.** Masao Yoshiki and Hirosi Kihara. *Ciencia y Tecnica de la Soldadura,* v. 7, Nov-Dec. 1957, 23 p.

Japanese shipyards are building 60,000-ton ore and oil transport vessels. Organization of welding departments, accounting and shop order procedures; techniques and equipment; figures on total welded lengths, weights of welded elements, man-hours; mechanical aids, electrode and flux consumption, power consumption; training of welders, metallurgical and technical problems.
(K general, A5, A6, T22)

172-K.* (Pamphlet.) **Soldering Aluminium.** A. D. A. Information Bulletin 23, Nov. 1957. 35 p. Aluminium Development Assoc., 33 Grosvenor St., London, W.1, England. 2 s.

Basic principles; alloys suitable for soldering; types of solders and fluxes; methods and equipment; soldering Al to other metals; characteristics of soldered joints; choice of solder and soldering methods. 14 ref. (K7; Al)

173-K. (Book.) **New Lessons in Arc Welding.** 301 p. 1957. Lincoln Electric Co., Cleveland 17, Ohio.

Basic information on theory and techniques. Lessons deal with welding of a variety of materials. Operating procedures and information on machines and electrodes. (K1)

174-K. Bonding Ceramics to Metal. Pt. 2. A. E. Williams. *Ceramics,* v. 9, Dec. 1957, p. 26-30.

Methods of bonding ceramic materials in pipe systems and filtration processes. (K11b)

175-K. (German.) **Submerged-Arc Welding.** M. Komers. *Schweisstechnik,* v. 11, Sept. 1957, p. 97-100.

The metallurgical processes involved in forming a weld depend upon the powdered flux and the bare wire electrode used in unshielded welding. Proper selection improves

the mechanical properties of the weld. Materials listed; application and economy in the re-use of flux. (K1e, W29h, W29j, 1-52)

176-K. Welded Castings Keep Turbines Humming. Robert N. Williams. *Industry and Welding,* v. 31, Feb. 1958, p. 36-37, 60.
(K1e, W11k, 17-57)

177-K. Dip Braze Your Aluminum Assemblies. James W. Maston. *Industry and Welding,* v. 31, Feb. 1958, p. 38-39, 60.
(K8n; Al)

178-K. Ultrasonic Welding Without Fusion. *Industry and Welding,* v. 31, Feb. 1958, p. 54, 56-57.
(K6r)

179-K. (German.) **Measuring Techniques in Resistance Welding.** Otto Gengenbach. *Schweissen und Schneiden,* v. 10, Jan. 1958, p. 1-12.
Characteristics; measurement of currents, electrode pressure and other parameters. 11 ref. (K3, K9r)

180-K. (German.) **Control Devices for Single and Multiple Operation in Resistance Welding.** Heinz Neumann. *Schweissen und Schneiden,* v. 10, Jan. 1958, p. 12-15.
(K3, W29c)

181-K. (German.) **Control Equipment for Continuous Seam Welding.** Albert Gericke. *Schweissen und Schneiden,* v. 10, Jan. 1958, p. 15-20.
5 ref. (K3p, W29c)

182-K. (Italian.) **Report on the Dynamic Behavior of Direct Current Rotary Arc Welding Machines. Fourth Group of Experimental Tests.** Antonio Carrer. *Rivista Italiana della Saldatura,* v. 9, Sept-Oct. 1957, p. 201-226.
Conclusion. (K1, 1-52)

183-K. Brazing Strip Eliminates Rejects. *Steel,* v. 142, Feb. 10, 1958, p. 83-84.
Prediffused to ferrous or nonferrous strip, Ag brazing alloy doesn't run on heating. The braze is continuous, uniform and covers the entire joint area. (K8, Q27a, Ag, SGA-f)

184-K. Aluminum Dip Brazing Produces Strong, Clean Assemblies Rapidly at Low Cost. M. E. James. *Western Metalworking,* v. 16, Jan. 1958, p. 41-43.
(K8n, T24b, T1c; Al)

185-K.* Bonding Ceramics to Metals. A. E. Williams. *Industrial Finishing (London),* v. 10, Jan. 1958, p. 22-26.
Examples of bonds between variety of metals and ceramic materials utilizing adhesives containing silicate rubber or synthetic resin base. (K11b)

186-K. Stress Relief of Weld Layers Assures Quality Repair. *Iron Age,* v. 181, Jan. 30, 1958, p. 98-99.
Stress relieving alternated with arc welding prevents accumulation of residual stresses which might cause cracking in repairing large cast steel crankshafts.
(K1a, J1a; ST, 5-60, 18-72)

187-K.* High Penetration Produces High Strength Brazed Joints. James W. Maston. *Modern Metals,* v. 14, Feb. 1958, p. 36-39.
Dip brazing of Al allows easier fabrication of complex parts which would normally require precision casting and machining. (K8n; Al)

188-K.* How to Weld Copper and Its Alloys. Pt. 2. Lester F. Spencer. *Steel,* v. 142, Feb. 24, 1958, p. 90-98.
Recommendations for metallic arc welding of copper, brass, silicon bronze, phosphor bronze and aluminum bronze; preferred techniques, electrode, pretreatment and joint design. (K1, Cu)

189-K. Equipment for Welding Reactive Metals. A. Mombrun and W. G. Hull. *Welding and Metal Fabrication,* v. 26, Jan. 1958, p. 9-11.
Vacuum welding chamber for tungsten inert-gas-shielded welding of Ti, Zr, Cb, Ta or V-base alloys under controlled conditions.
(K1d, 1-52, 1-73; Ti, Zr, Cb, Ta, V)

190-K. Portable Spot Welding Equipment. C. W. J. Vernon. *Welding and Metal Fabrication,* v. 26, Jan. 1958, p. 12-18.
5 ref. (K3n, 1-52)

191-K. A New Brazing Technique. Charles E. Rorick. *Welding and Metal Fabrication,* v. 26, Jan. 1958, p. 19-21.
Brazing of 17-7PH stainless steel honeycomb panels with Ag-Mn alloy in new graphite brazing fixtures at Convair. (K8, Ag, Mn, SS, 7-59)

192-K.* Inert-Gas Tungsten-Arc Welding SAE 4130 Steel Sheet. Pt. 3. Effects of Welding Speed on Cracking. C. A. Terry and W. T. Tyler. *Welding and Metal Fabrication,* v. 26, Jan. 1958, p. 24-31.
Assessed by radiographic and visual examinations, the effect of welding speed varying from 4 to 22 in. per min. on number and length

of transverse cracks occurring in 0.055 and 0.104-in. thick welded sheet. Data obtained from metallographic examination, microhardness and macrohardness tests of welds formed at various speeds and patch and Pellini hot cracking tests indicate that cracking encountered occurred at or near solidus temperature. 4 ref.
(K1d, 3-67; AY, 4-53, 9-72)

193-K.* Welding Certain Heat and Corrosion-Resistant Alloys. Some Practical Aspects Reviewed. R. C. Perriton and R. T. Phillips. *Welding and Metal Fabrication,* v. 26, Mar. 1958, p. 98-102.

Welding techniques for Hastelloy alloys B, C, F and X; Multimet alloy (N155) and Multimet No. 25, to avoid poor bend contour, flux pockets, porosity, overheating and microfissuring.
(K-general; Ni, Co, SGA-g, SGA-h)

194-K.* Inert-Gas Tungsten-Arc Welding SAE 4130 Steel Sheet. Pt. 5. Mechanism of Hot Cracking. C. A. Terry and W. T. Tyler. *Welding and Metal Fabrication,* v. 26, Mar. 1958, p. 103-110.

Transverse cracks probably occur at temperatures above the solidus, arising from interaction between effects due to metastability and construction. The extent of cracking is a function of welding speed and is increased by the presence of pearlite-ferrite banding and other microstructural features. 17 ref.
(K1d; AY, 4-53, 9-72)

195-K. Kaiser's 3 New Mig Techniques for Welding Aluminum. *Welding Engineer,* v. 43, Mar. 1958, p. 36-38.

To eliminate porosity and dross in welding Al, two new processes using argon or helium plus chlorine in the contact tube, with conventional gases in the nozzle, have been developed. A third method utilizes nitrogen in the gas nozzle, and argon or helium plus nitrogen in the contact tube. (K1d; Al)

196-K. Flux in Flame Finds Greater Applications. E. H. Conway. *Welding Engineer,* v. 43, Mar. 1958, p. 40-42.

In this brazing process, flux is held in solutions in a highly volatile, flammable liquid and fed to the torch tip in regulated amounts. Excessive fluxing is avoided, yet brazing surfaces are protected against oxidation. (K8g)

197-K.* Fusion Welding of Uranium. E. L. Brundige, Denton T. Doll, Gale S. Hanks and James M. Taub. Paper from "Nuclear Metallurgy", v. 4, AIME, p. 107-115.

Techniques for producing sound welds with uranium sheet, plate and shapes using inert-gas tungsten-arc process. Microstructure and mechanical properties of welds; other welding techniques. (K1d; U)

198-K. (Dutch.) **Vertical Welding Without Preliminary Processing.** A. J. v. d. Velde. *Lastechniek,* v. 24, Feb. 1958, p. 17-19.

In arc welding with normal electrodes the edges of the workpieces have to be given special shaping. In a modified process of vertical welding two welders work simultaneously and the preliminary processing can often be omitted. (K1)

199-K. (French.) **Electric Welding.** *L'Electricien,* v. 86, Jan. 1958, p. 6-9.

Generalities; power supply, technique of arc welding; use of metal electrodes; arc formation. (To be continued.) (K1)

200-K. (German.) **Welding Gray Iron With Small Heat Consumption.** G. M. Blanc. *Industrie Anzeiger,* v. 79, Aug. 16, 1957, p. 990-993.

(K-general; CI-n)

201-K. (German.) **New Experiment With Cold Pressure Welding and Cold Pressure Soldering.** Wilhelm Hofmann. *Industrie-Anzeiger,* v. 79, Nov. 15, 1957, p. 1435-1439.

This technique makes it possible to weld Al and Pb, and to solder iron and Pb. 13 ref.
(K6, K7; Al, Fe, Pb)

202-K.* (German.) **Welding of Heat Resisting Steels.** H. H. Weigand. *Schweissen und Schneiden,* v. 10, Feb. 1958, p. 44-49.

Welding of heat resisting austenitic steels is performed mostly by means of similar filler materials. Most favorable results result from arc welding with basic coated electrodes. Heat treatment of weld seam improves its quality. Hot cracking is promoted by sulphur, phosphorus and silicon and reduced by small amounts of carbon, manganese and ferrite. (K1, K9; SS, 9-72)

203-K.* (German.) **Experimental Analysis of the Joining Process in Soldering.** J. Colbus. *Schweissen und Schneiden,* v. 10, Feb. 1958, p. 50-54.

Mechanism of joining; temperature measurements in soldering; joints of the same parent and filler metals; tensile strength testing. Optimum joints demand a liquid layer between solder and parent metal. Minimal temperature at which a joint can be effected varies with different metals. (K7)

204-K. (German.) **Inert-Gas Tungsten-Arc Welding of Sheet Steel for Transformers and Dynamos.** J. Ruge and W. Rauchfuss. *Schweissen und Schneiden,* v. 10, Feb. 1958, p. 55-58.

(K1d, W11q, W11r, 17-57; ST, SGA-n, 4-53)

205-K. (German.) **Testing Materials in Welding.** M. Pfender. *Schweisstechnik,* v. 11, Nov. 1957, p. 121-135.

Composition and structure of materials, chemical and mechanical properties, resistance to the effect of attacking media; possibility of modifying the materials, new materials and combinations, necessity of developing methods and tools; importance of standards; problems of brittle fracture and vibration. 36 ref. (K9r)

206-K. (German.) **Basic Lime Coated Electrodes for High-Quality Welding.** Alfred Schmidt. *Schweisstechnik,* v. 11, Dec. 1957, p. 143-150.

Various types of lime coated electrodes. Welding techniques and applications. (K1a, W29h)

207-K.* **Semi-Automatic Welding.** Robert N. Williams and Herb Hinkel. *Industry and Welding,* v. 31, Apr. 1958, p. 48-51, 108-109.

Three processes use flux to shield the weld puddle: Unionarc uses a continuously fed wire electrode that is magnetically coated with flux and shielded by a flow of CO_2; dual shield, a continuous flux-cored electrode, is fed through gun equipment to the welding arc; mechanized squirt welder controls wire feed, flux flow and travel. Four processes use gas shielding: Wes-ing-Gun, a portable gas-shielded gun; Migarc, a gas-shielded welder; C-O manual uses CO_2 on mild steel to speed travel; Aircomatic uses same control box with one of three wire feeders and one of four guns. (K1d; 1-52)

208-K. Three Ways to Weld Aluminum Without Porosity. *Industry and Welding,* v. 31, Apr. 1958, p. 56, 80.

Three processes, Qualiweld, Econoweld and Chlorecon, involve addition of chlorine or nitrogen to the shielding gas. (K1d, K9, 2-60; Al)

209-K. Progress in the Joining of Aluminum. N. T. Burgess. *Metallurgia,* v. 57, Mar. 1958, p. 117-121.

Capabilities and limitations of various methods of joining Al. 9 ref. (K-general; Al)

210-K.* **Brazing Salvages Cracked Stampings.** E. H. Conway. *Steel,* v. 142, Mar. 3, 1958, p. 110-115.

Three procedures are necessary to make the technique work: peening to form V-shape depression the full length of crack, employing flame fluxing process which prevents oxidation of the surface and cleaning problem, and brazing with Ni-Ag filler rod. (K8; ST, 4-59)

211-K. Practical Application of Inert-Gas Metal-Arc Welding to Some Aluminum Alloys. E. M. Wilson. *Welding and Metal Fabrication,* v. 25, Dec. 1957, p. 474-481.

(K1d; Al)

212-K.* **Dip Brazing of Magnesium —Possible, Practical and Efficient.** William J. Graves. Paper from "Magnesium in Perspective", Magnesium Association, p. 400-403.

Dip brazing requires thorough prior cleaning and deburring. The joints show no cracks, little porosity under X-ray examination. Ultimate tensile strength drops about 10% due to heating; corrosion resistance equal to or better than similar welded items. (K8n; Mg)

213-K.* **Workable Method for Continuous Welding of Magnesium Proves Highly Efficient.** Ray Miles. Paper from "Magnesium in Perspective", Magnesium Association, p. 1500-1506.

Consumable electrode argon-arc welding, at speeds up to 80 in. per min., produces sound welds, with only minor "burn back" problems. (K1d; Mg)

214-K. (German.) **Brazing Hard Metals on Steel.** E. Luder, etc. *Fertigungstechnik,* v. 7, Oct. 1957, p. 449-452.

Pure Cu brazing metal with 2% ferrosilicon (45% Si) and borax flux at a furnace temperature of 1100-1200° C. gives a strong bond between the overlapping surfaces. The process, surface alloying conditions, Vickers hardness values of joint areas, results of microscopic examination. 8 ref. (K8; ST, SGB-q, *Cu*)

215-K.* (German.) **Influence of Hydrogen on Chemical Composition and Structure of Steel. Weldability of Killed and Rimming Carbon Steel.** Friedrich Erdmann-Jesnitzer and Paul Dammkohler. *Neue Hütte,* v. 2, Oct. 1957, p. 637-645.

Results of test welding; strength after cold bending; immersed arc welding; porosity; electrode evaluation. 25 ref.
(K9s, 2-60, 3-71; ST-c, ST-d, *H*)

216-K. (German.) **Effect of a Second Cutting Operation on the Stress Distribution in Shrink Fit Constructions.** H. Bühler and W. Schepp. *Werkstatt und Betrieb,* v. 91, Mar. 1958, p. 141-145.

Mathematical calculation of change in inherent stress and contact pressure. 12 ref. (K13r, Q25, G17)

217-K.* (German.) **Cold Pressure Welding and Brazing.** F. C. Fritz. *Werkstoffe und Korrosion,* v. 9, Jan. 1958, p. 4-7.

Lap brazing is rarely applied; butt brazing is used at places impossible to weld. Necessary tools and quality of the welds; historical discussion. 5 ref. (K5, K8)

218-K.* **Dual Fixturing Boosts Brazing Rate.** W. E. Atkinson. *Iron Age,* v. 181, no. 6, Feb. 6, 1958, p. 100-101.

Study of brazing line shows that duplicate fixtures at each induction machine will increase output of bicycle frames. Each operator can load a fixture while brazing is in progress in the duplicate one—this more than doubles production.
(K8k)

219-K. **Machine Soldering Cuts Costs, Doubles Small Shop's Output.** Robert Mortensen. *Iron Age,* v. 181, Mar. 27, 1958, p. 100-101.

(K7, T10d; Cu-a, Cu-n)

220-K. **How and Where to Use Shielding Gases for Welding.** O. T. Barnett. *Iron Age,* v. 181, Apr. 10, 1958, p. 91-98.

(K1d)

221-K. **Resistance Welding Joins Swing to Automation.** R. H. Eshelman. *Iron Age,* v. 181, Apr. 10, 1958, p. 99-103.

(K3, 18-74)

261-K. How to Braze Stainless Steels. Pt. 1. H. M. Webber. *In-*

dustrial Heating, v. 25, Feb. 1958, p. 247-254, 400-402.

Important considerations and characteristics of base and filler metals so that proper thickness of joint, required wettability and optimum furnace conditions can be ascertained to insure tight bonds. (K8j; SS)

262-K. 5 New Brazing Alloys for High-Temperature Service. A. M. Setapen. *Industry & Welding,* v. 31, May 1958, p. 51-52, 54-55.

Composition, properties and industrial applications of Ag-Cu-Li, Ag-Pd, Mn-Ni, Ni-Cr-Si-B and Au-Cr-Ni heat resistant alloys for rocket and jet engine assemblies. (K8, SGA-h, SGA-f)

263-K. Designed for Arc Welding. G. A. Marberg. *Industry & Welding,* v. 31, May 1958, p. 58, 62-63.

Welded equipment for processing and manufacturing can be built faster at less cost because no patterns are needed, slow casting and machining are avoided, standard steel shapes and weld symbols are used for designing. The equipment made will be lighter, sturdier and better looking. (K1, 7-51, 17-51)

264-K. Design and Fabrication by Welding of the Carquinex Strait Bridge. Leonard C. Hollister. *Welding Journal,* v. 37, Apr. 1958, p. 309-319.

Cantilever truss-type structure fabricated by submerged arc welding of T-1 steel. (K1e, T16n, 17-51; ST)

265-K.* Automatic Welding of Aircraft Accessory Turbine Wheels. A. J. Rosenberg and E. W. Jamison. *Welding Journal,* v. 37, Apr. 1958, p. 328-335.

Development of automatic inert-gas-shielded metal-arc welding procedure for turbine wheels consisting of AISI 4340 steel hubs and cast cobalt-base high-temperature alloy buckets. Difficulties including radial cracking, fusion-line cracking, transformation cracking, center-bead cracking and porosity. Procedure for minimizing defects; comparison of automatic and manual metal-arc welding processes.

(K1d; AY, 9-72, 9-68)

266-K.* Tungsten-Arc Welding of 0.002-In. and 0.005-In. Stainless Steel and Titanium. Jay C. Collins and S. P. Jenkins. *Welding Journal,* v. 37, Apr. 1958, p. 342-347.

Equipment, procedure and mechanical properties of joints in welding 0.005-in. 17-7PH stainless steel by helium-shielded tungsten-arc process. Flange-type joint gave welds of satisfactory dimensional tolerance. (K1d; SS, Ti)

267-K.* New Forge Welding of Aluminum and Magnesium Alloys. L. A. Cook and D. G. Shafer. *Welding Journal,* v. 37, Apr. 1958, p. 348-358.

Principles, equipment and procedure for forge welding high-strength Al and Mg alloys. Metallographic, hardness and tensile characteristics of weld. Welds in high-strength Al and Mg alloys developed 95 to 100% joint efficiency. 44 ref. (K5; Al, Mg)

268-K.* Spot Welding of Ti-6Al-4V Alloy. R. K. Nolen, J. F. Rudy, H. Schwartzbart and H. D. Kessler. *Welding Journal,* v. 37, Apr. 1958, p. 129s-137s.

Electrode geometry, weld time, electrode force, welding current and weld spacing were varied to determine their relation to cross tension strength, tension shear strength, microstructure and elevated-temperature strength of spot welds made in Ti-6 Al-4V alloy. (K3n; Ti-b)

269-K.* Seam Welding Galvanized Steel. W. J. Allen and M. L. Begeman. *Welding Journal,* v. 37, Apr. 1958, p. 138s-143s.

Changes in welding current, current timing and electrode force required to produce acceptable seam welds with zinc-coated steel sheet. Effect of Zn coating on mechanical properties, metallurgical characteristics and corrosion resistance of the weld metal. (K3p; ST, *Zn,* 8-65)

270-K.* Hydrogen in Mild Steel Welds. M. LeFevre. *Welding Journal,* v. 37, Apr. 1958, p. 168s.

Effects of moisture in electrode coat, humidity, interpass temperature, time interval between passes and degassing on the hydrogen content of mild steel welds. (K1a; CN, *H,* 7-51)

271-K.* Effects of Steel-Making Practice on Submerged-Arc Weld Porosity. James T. Lapsley. *Welding Journal,* v. 37, Apr. 1958, p. 169s-178s.

Nominally similar low-carbon steels representing four deoxidation practices including Al-Si semikilled, Si semikilled, Al-capped and mechanically capped steels were welded by submerged-arc processes. Ef-

fect of deoxidation practice, teeming sequence, ingot variations, rolled sheet variations and chemical composition on weld porosity.
(K1e, D-general, 3-70; CN-g, 9-68)

272-K.* Dynamic Measurement of Stress Associated With Weld Cracking. S. S. White, W. G. Moffatt and C. M. Adams. *Welding Journal,* v. 37, Apr. 1958, p. 185s-192s.

Techniques and specimen geometries developed which permit dynamic measurement of stresses during and after welding by use of conventional strain gages. Measurements and stress analysis indicate medium-carbon filler welds on Mn-Mo steel plate can support maximum stress of about 40,000 psi. before cracking of the welds during cooling and that low-carbon, low-alloy filler welds in the same material can support a maximum stress of about 25,000 psi. Maximum transverse distributed load which precedes cracking appears to be less dependent on welding conditions than upon filler compositions. 19 ref. (K9r, Q25; 7-51, 9-72)

273-K. How to Weld Copper and Its Alloys. Pt. 4. Lester F. Spencer. *Steel,* v. 142, May 5, 1958, p. 106-108.
(K3, 4-53; Cu)

274-K.* Welding of Molybdenum. W. N. Platte. Paper from "The Metal Molybdenum", American Society for Metals, p. 151-191.

Shielding is necessary to prevent contamination of the weld metal by oxygen and nitrogen. For sound welds with maximum ductility, welding atmosphere must contain less than 0.005% O. Nitrogen in the argon should be low enough so it will not enter the weld metal. Addition of 0.5% Ti to Mo containing 0.05% C will give the best (lowest) ductile bend transition temperature for welds. 11 ref. (K1d; Mo)

275-K.* Brazing of Molybdenum. Robert E. Monroe. Paper from "The Metal Molybdenum", American Society for Metals, p. 192-198.

Tabulation of suitable filler metals. Molybdenum can be furnace brazed in inert or hydrogen atmospheres or in vacuum, oxy-acetylene torch brazed with suitable fluxes, and induction brazed. Properties of joints. 6 ref. (K8; Mo)

305-K. How to Weld Copper and Its Alloys. Pt. 3. Lester F. Spencer. *Steel,* v. 142, Mar. 17, 1958, p. 110-116.

(K1h, K2h; Cu-b)

306-K. Paste Solders Automate Assembly. *Steel,* v. 142, June 2, 1958, p. 68-69.

Furnace soldering and brazing with metered paste. (K7g, K8j, 18-74)

307-K.* Automatic Machines Expedite Arc Welding. D. L. Hansen. *Tooling and Production,* v. 23, Mar. 1958, p. 61-64.

Typical of large assemblies involving much arc welding are the blades required on bulldozers and on graders. One such blade includes a heavy curved plate and welded to this are stiffening and supporting members involving several long automatic welds. (K1e, 1-52, K13p, T3n)

308-K. A Wine Tanker With a "Stainless" Reputation for Quality. Philip Ferry. *Welding Engineer,* v. 43, Apr. 1958, p. 38-39.

Welding the world's first tanker designed principally for wine transportation. (K1e, T22j; SS, SGA-g)

309-K. (Czech.) **Evaluation of Fluxes for Automatic Welding as Regards Their Suitability for Molten Slag Welding.** Julius Zeke. *Zvaranie,* v. 7, Apr. 1958, p. 97-102.

(K1e, 18-74; RM-q)

310-K. (Czech.) **Oxidation of Metal in Arc Welding.** A. A. Jerochin. *Zvaranie,* v. 7, Apr. 1958, p. 109-112.

Metallurgical conditions causing some metals to oxidize in welding. For the given materials oxidation is found to progress more intensely when welded with a limestone-coated electrode than in an atmosphere of CO_2. 10 ref. (K1a, K1d, R1h)

311-K. (Dutch.) **Welding of Stainless Steel.** B. Mulder. *Lastechniek,* v. 24, Apr. 1958, p. 51-57.

Scratches, slight damages, small dents or nicks, etc., permissible in ordinary steel plates, cannot be tolerated in high-luster stainless steels. This raises some practical problems on the grinding and polishing of the welded joints of stainless steel plates. (K-general; L10b, SS)

312-K. (French.) **Welding Metallurgy, on the Basis of the Papers Presented at the Public Session of the International Institute of Welding, Essen, July 1, 1957.** H. Granjon. *Soudage et Techniques Connexes,* v. 12, Mar-Apr. 1958, p. 85-100.

Analysis of 26 papers grouped under the following items: development and properties of the molten zone (welding atmosphere, dissolution of gases, effect of hydrogen); behavior of the base metal (ferritic, martensitic and austenitic steels, nonferrous metals such as Ti, Mg, Ni and Al); metallurgy of the bonding zone. 26 ref. (K-general)

313-K.* (German.) **Load-Carrying Capacity of Silver Brazed Joints in Thin-Walled Steel Tubes.** Helmut Koch and Karl-Ludwig Poth. *Schweissen und Schneiden,* v. 10, Apr. 1958, p. 114-119.

Experiments with Ag brazing of various joints on steel tubes. Technique and results. High tensile and shear strength reached. (K8; ST, 4-60)

314-K.* (German.) **Influence of Current Strength on Arc Welded Butt Joints From the Economic and Qualitative Point of View.** C. Stieler. *Schweissen und Schneiden,* v. 10, Apr. 1958, p. 119-125.

Investigation on relationship between current strength, diameter of electrodes and welding speed using bare and covered electrodes. Influence of current strength on mechanical properties of weld. (K1a, K1g)

315-K.* (German.) **Effect of Welding Method on Discoloring of Welds During the Anodizing of Welded Joints in**

Aluminum and Aluminum Alloys. J. Ruge and Zitzelsberger. *Schweissen und Schneiden,* v. 10, Apr. 1958, p. 125-131.

Experiments with various methods, materials, edge preparation, welding conditions; effects of microstructural processes produced by welding. Discoloring in homogeneous and heterogeneous alloys.
(K-general, L19; Al)

316-K.* Welding Low-Alloy Steel Castings. N. A. Chapin, C. H. Soldan and L. W. Songer. *Foundry Trade Journal,* v. 104, May 22, 1958, p. 597-600.

Fabrication and repair welding of large alloy steel castings for use in steam turbines operating up to 566° C. and at pressures up to 1.6 tons per sq.in. Castings vary in weight from 1000 lb. to about 35-36 tons.
(K-general, W11k, AY, 5-60)

317-K. Resistance Seam Welding Fits Into High-Speed Lines. C. E. Roth. *Iron Age,* v. 181, June 5, 1958, p. 130-131.

Integrated process line of this type in operation at Buick for production of Dynaflow transmission stator rings. (K3p, T21b)

318-K. Successful Welding for Maintenance. M. Kolb. *Petroleum Refiner,* v. 37, May 1958, p. 207-210.

(K-general, 18-71)

319-K. New Process Features Close Control of Brazing Heat. *Welding Engineer,* v. 43, June 1958, p. 38-39.

(K8; Al-b, Mg-b)

320-K. Welding of Gears Under Protection of Carbon Dioxide. N. N. Belous. *Svarochnoye Proizvodstvo,* no. 3, 1956, p. 20-22. (Iron and Steel Institute Translation no. 729.)

Previously abstracted from original. See item 260-K, 1956.
(K1; CN, AY)

321-K. 13KH3GNMA Welding Wire for the Automatic Welding of 30KLGSA Steel. T. M. Slutskaya. *Avtomaticheskaya Svarka,* Mar-Apr. 1956, p. 12-17. (Iron and Steel Institute Translation no. 730.)

Previously abstracted from original. See item 317-K, 1956.
(K1, W29h; ST)

322-K. (German.) **Economical Assembly of Copper Pipes With Soldered Fittings.** Wolfgang Schmidt. *Werkstatt und Betrieb,* v. 91, Apr. 1958, p. 165-168.

4 ref. (K7, K8; Cu, 4-60)

323-K.* (Book.) **Brazing Manual.** 28 p. 1958. All-State Welding Alloys Co., Inc. White Plains, N. Y.

Brazing sheet, tappings, tubings and assemblies of Cu, brass, steel, stainless steel, cast iron or Al. Techniques, properties and uses of fluxes. (K8)

324-K. (Book.) **Welding Handbook.** Section 1. 4th Ed. 1957. 560 p. American Welding Society, 33 East 39th St., New York 18, N. Y. $9.

Divided into five major sections, new sections being published at the end of each year. Major topics include standard definitions, conversion factors, thermal properties of welded joints, thermal and mechanical treatment of welds, inspection and tests, design techniques and safe practice. (K-general; 11-68)

325-K. (Book.) **Welding Directory, 1958/1959.** 1957. 680 p. Industrial Publishing Corp., 812 Huron Rd., Cleveland 15, Ohio. $6.50.

Directories of welding, brazing and cutting products; trade names; catalog and specification data; reference material; geographical buyers guide.
(K-general, 11-67, 11-62, 11-69)

326-K. Resistance Welding of Platinum-10 Per Cent Rhodium Wire to Platinum Sheet. C. E. Moeller. *American Society of Mechanical Engineers,* Paper no. 57-A-118, Aug. 1957, 9 p.

(K3; Pt, 4-53, 4-61, SGA-a)

327-K. High-Temperature Brazing Looks Good for Missile Parts. John V. Long and George D. Cremer. *Aviation Age,* v. 29, May 1958, p. 30-31.

(K8, T24; Ag, SS)

328-K. A Method for Soldering Aluminum. G. M. Bouton and P. R. White. *Bell Laboratories Record,* v. 36, May 1958, p. 157-160.

New technique using Zn-base solders. (K7; Al-b)

329-K. How to Braze Stainless Steels. Pt. 4. H. M. Webber. *Industrial Heating,* v. 25, May 1958, p. 895-896, 898, 900, 902, 904.

(Concluded.)
(K8j, W29j, 1-73, 2-67; SS)

330-K. Six Steps for Dip Brazing of Magnesium Assemblies. William J. Graves. *Industry and Welding,* v. 31, June 1958, p. 38-39.

Magnesium alloy parts dip brazed with parent metal base filler alloys in chloride-base fluxes.
(K8n; Mg-c, RM-q)

331-K. New High Speed Automatic Welding Process. *Industry and Welding,* v. 31, June 1958, p. 51, 65.

Process and equipment using new flux-containing, coiled wire electrode; arc welds 16-gage to ½-in. steel at speeds to 300 in. per min. (K1, 1-52)

332-K. Flash Welding Jet Rings Cuts Cost. *Industry and Welding,* v. 31, June 1958, p. 52, 54.

Preshaped Ti used for jet engine rings reduces cost of machining. Rings are made in three steps; forming, flash welding and sizing. (K3r; Ti)

333-K. Alloy Selection for Brazing. L. V. LaRou. *Machine Design,* v. 29, Nov. 1957, p. 132-135.

Criteria in selection of Ag or Cu brazing process. (K8; Cu, Ag, SGA-f)

334-K. Sandwich Panel Adhesives. R. K. Humke. *Product Engineering,* v. 29, May 1958, p. 56-60.

(K12, 7-59; NM-d34)

335-K. New Welder Saves Firm $150,000 Yearly. *Steel,* v. 142, June 9, 1958, p. 88-89.

(K1d, K9, 1-52)

336-K.* Factors Affecting Weldability of High Strength 1 Per Cent Chromium-Molybdenum and Other Steels. F. J. Wilkinson and C. L. M. Cottrell. *Welding and Metal Fabrication,* v. 26, May 1958, p. 171-184.

Study of factors affecting hot cracking in weld made in SAE 4130 and other steels of similar composition by means of argon-shielded tungsten-arc process. Influence of sulphur, phosphorus and carbon content, grain size, microstructural conditions and heat treatment on crack sensitivity. Sulphur found to be major cause of cracking. Effect of sulphur increased by raising level of phosphorus. Increasing carbon content likewise reduced resistance to cracking by modifying effect of sulphur. 24 ref.
(K9s, 2-60; AY, *Cr, Mo*)

337-K.* Fusion Welding of Titanium in Jet-Engine Applications. H. W. Hoefer. *Welding Journal,* v. 37, May 1958, p. 467-477.

Welding chambers, shielding equipment, welding variables and results obtained in joining commercially pure Ti and alpha-alloy and alpha-beta Ti alloys by inert-gas-shielded tungsten-arc and metal-arc processes. Problem of porosity and its relation to welding speed, weld chill and joint design. Control of weld embrittlement. Note on resistance welding. 5 ref.
(K1d, K3; Ti-b, 7-51, 9-68)

338-K.* Cracking Associated With Porosity in Titanium Welds Over 0.125 In. Thick. R. P. Olsen and J. Gates. *Welding Journal,* v. 37, May 1958, p. 478-483.

Inert-gas tungsten-arc welds were made in 0.125 and 0.18-in. sheet of titanium alloy containing 2½% Sn and 5% Al. X-ray examination failed to reveal presence of microcracks demonstrated by metallographic investigation. Microhardness survey, chemical analysis, X-ray studies and metallographic examinations made to establish cause of cracks. Tensile loading of weld specimens revealed that inert-gas metal-arc process produced crack-free welds under conditions which resulted in cracking with tungsten-arc processes. (K1d, K9r, S13e; Ti-b, 9-72)

339-K.* Spot Welding of Rail Steel. D. Canonico and H. Schwartzbart. *Welding Journal,* v. 37, May 1958, p. 484-488.

Results of survey of companies spot welding reroll rail steel to mild steel in the manufacture of their various products. Data on successfully used welding procedures. Three companies utilized pulsation welding to reduce severity of quench of the weldment. One company made no provision for slow cooling. (K3n; CN-g, CN-p, 4-57)

340-K.* A Study of Factors Affecting the Strength and Ductility of Weld Metal. C. M. Wayman and R. D. Stout. *Welding Journal,* v. 37, May 1958, p. 193s-200s.

Effect of welding variables on mechanical properties of submerged-arc and inert-gas metal-arc welds in ingot iron, ASTM A212, and eutectoid steel. Variation in weld metal properties with preheating, travel speeds, welding current, number of passes, energy input, cooling rate, heat treatment including annealing, normalizing, austenitizing, quenching and stress-relieving. Influence of base metal composition, restraint on weld metal and prestrain of weld metal on tensile properties. 65 ref.
(K1d, K1e; CN-b, 2-64)

341-K.* The Effects of Porosity on Mild-Steel Welds. William L. Green, Mahmoud F. Hamad and Roy B. McCauley. *Welding Journal,* v. 37, May 1958, p. 206s-209s.

Tensile bending and impact test used to measure effects of porosity on mechanical properties of welds made by submerged-arc and inert-gas metal-arc processes in AISI 1020 steel. Welds were inspected with

X-ray. Results show that cross section of welds tested could be reduced by porosity up to about 7% without materially changing the mechanical properties.
(K1d, K1e, K9r, 9-68; CN)

342-K.* Cooling Rates and Peak Temperatures in Fusion Welding. Clyde M. Adams, Jr. *Welding Journal,* v. 37, May 1958, p. 210s-215s.

Derived relationships giving peak temperatures and centerline cooling rates directly as functions of geometric, thermal and welding variables. Expressions are close approximations derived from published temperature equation, usually active to within 5% and in accord with experimental findings. Factors determining whether heat flow is two or three-dimensional. 8 ref.
(K1, K2, K9n, 2-61; ST, Al, 4-53)

343-K. Behavior of Welded Corner Connections. John W. Fisher, George C. Driscoll, Jr., and F. W. Schutz, Jr. *Welding Journal,* v. 37, May 1958, p. 216s-232s.

Tests on straight-corner connections for welded ridged portal frames. Connections proportioned using concepts of plastic analysis. Effect of member size on connections fabricated of large rolled steel sections. 9 ref.
(K9r, 3-73, 4-57, 7-51, 17-51; ST)

344-K.* High-Temperature Vacuum Brazing of Jet-Engine Materials. E. G. Huschke, Jr., and G. S. Hoppin. *Welding Journal,* v. 37, May 1957, p. 233s-240s.

Vacuum requirements for brazing; gas evolution of materials in vacuum; strength of vacuum brazed versus hydrogen brazed joint and alternate methods to vacuum brazing for representative superalloy containing small amounts of Ti and Al which form heavy nonreducible oxide films during hydrogen brazing. 6 ref. (K8j, 1-73, SGA-h, Co, Al, Fe, Ni, Ti)

345-K. (Dutch.) **Welding of Metal Plate Laminated With PVC Foil (Marvi-Bond).** M. Doucet. *Plastica,* v. 11, Mar. 1958, p. 178-181.

(K1; Al-b, ST, 7-59)

346-K. (German.) **Weldability of Steels for Engineering Structures.** K. L. Zeyen. *Der Bauingenieur,* v. 32, 1957, p. 209-217, 420-428.

Weldability, welding suitability and welding safety. Proposals for the systematic classification of weldability specimens. Tests for determination of weldability with reference to choice of materials. Notch-resistant weld beads for preventing the propagation of brittle cracking. 96 ref. (K9r, K9s, ST)

347-K. Multiple Arc Multipies Welding Speed. *American Machinist,* v. 106, June 16, 1958, p. 108-109.

(K1e)

348-K. Aluminum Waveguide, Weld or Braze? L. Virgile and J. Difazio. *Electronic Industries,* v. 17, Apr. 1958, p. 90-94.

(K8, K3; Al, Ti)

349-K. Automatic Brazing Speeds Making of Coils for Carrier Corp. Harry E. Miller. *Industrial Gas,* v. 36, Apr. 1958, p. 6-8.

(K8, T1b)

350-K.* New Vistas for Vinyl-Metal Laminates. R. P. Hooker. *Machinery,* v. 64, June 1958, p. 99-103.

The laminates can be deep drawn, sheared, crimped, bent, punched and drilled. Thickness ranges from 0.004 to 0.02 in. Steel, aluminum or magnesium, 0.015 to 0.060 in. thick, form the backing. Preparing the backing and applying the vinyl; projection-welding technique employing magnetic force.
(K11d; ST, Al, Mg)

351-K. Preliminary Investigation of the Tensile Properties of Beryllium Couplings. J. Greenspan. Nuclear Metals, Inc. U. S. Atomic Energy Commission, NMI-1196, Dec. 11, 1957, 29 p. (Order from Office of Technical Services, Washington, D. C.) $.75.

Couplings include Be to Be, to Type 316 stainless, and to 2S aluminum. Beryllium in bolted or riveted joints was capable of considerable plastic deformation before fracture, but in brazed joints it was not. Beryllium as part of a threaded couple has good tensile strength, but little ductility. 6 ref.
(K13; T27; Be; SS, Al)

352-K.* Fusion Welding of Titanium. C. A. Terry and E. A. Taylor. *Welding and Metal Fabrication,* v. 26, June 1958, p. 198-205.

Techniques used to make butt, billet, corner and lap welds in commercially pure Ti sheet from 0.028 to 0.125 in. thick.
(K-general; Ti-a, 4-53)

353-K. Electronic Welding of Metals. J. A. Stohr. Paper from "Fuel

Elements Conference", U. S. Office of Technical Services, T1D-7546, p. 9-17.

It is possible to produce an impact area of fixed dimensions on an object placed in the path of an electron beam. On that area an amount of energy would be dissipated, depending on the number of electrons (current intensity) and their acceleration potential. Localization of the energy and the use of a vacuum account for improvements in welds not obtainable by other methods. Remarkable results obtained on refractory metals (W, Mo and Ta) or easily oxidizable metals (Zr, Be and U). (K6)

354-K. Mechanism of Formation of Intercrystalline Cracks in the Heat Affected Zone in Fusion Welding. B. I. Medovar. *Soviet Physics, Technical Physics,* v. 2, (1957), p. 1454-1457. (Translated by American Institute of Physics, Inc.)

Argues that there is a direct link between the composition of the molten weld metal and the appearance of cracks in the heat-affected zone of the solid base metal. 5 ref. (K9, 9-72; ST)

355-K.* (German.) **Oxy-Acetylene Welding of Cast Iron.** Hans Reininger. *Giesserei-Praxis,* v. 76, Mar. 25, 1958, p. 101-104.

Repair for welding minor defects. For best results preheating is essential, but care should be taken to avoid structural changes and deterioration of mechanical properties due to heating. Composition of the material, design, shape or dimension of the object are important factors. (K2h, 18-72; CI)

356-K. Can Preheat Replace Stress Relief? H. Thomasson. *Canadian Metalworking,* v. 21, May 1958, p. 34-36.

Compares effects of preheating and stress-relief on properties of weldment. (K9p, K9q, J1a; 7-51)

357-K. Adhesive Bonding of Titanium Alloy. *Mechanical World and Engineering Record,* v. 138, June 1958, p. 277-278.

Procedures at Boeing Airplane Co. for bonding 6Al-4V Ti alloy to stainless steel honeycomb cores. (K12; Ti, SS, 7-59)

358-K. Adhesive Bonding. Arnold Ruskin. *Michigan Technic,* v. 76, Feb. 1958, p. 28-30, 48, 52.

Review of bonding techniques and materials. 24 ref. (K12)

359-K. Welding Aluminum and Its Alloys to Nuclear Standards. N. T. Burgess. *Nuclear Power,* v. 3, May 1958, p. 215-216.

The argon-arc process using a tungsten electrode is most adaptable, being used over a range of thicknesses, automatically or manually, with or without filler rod. (K1d, T11; Al)

360-K. Welding Magnesium Alloys. I. H. Morrison and A. F. Taylor. *Nuclear Power,* v. 3, May 1958, p. 217-218.

Argon-arc welding of Mg alloy cans for the Calder Hall reactor. (K1d, T11g; Mg-b)

361-K. Welding Techniques for the Rarer Metals. D. R. Harries and J. G. Purchas. *Nuclear Power,* v. 3, May 1958, p. 219-221.

Properties and optimum methods of welding zirconium, columbium, beryllium and uranium. 19 ref. (K-general, Zr, Cb, Be, U)

362-K. Corrosion and Heat Resisting Steel Fabrication. J. A. McWilliam. *Nuclear Power,* v. 3, May 1958, p. 222-223.

Welding of Cr-Ni steels. (K-general; SS)

363-K.* Vacuum Welding by Electron Beam. J. A. Stohr. *Nuclear Power,* v. 3, June 1958, p. 272-274.

Welding Zr, Al and other materials by means of a tungsten filament electron gun, which projects into a vacuum chamber. A thyratron controller chopper provides for intermittent cutting of the beam in case of strongly vaporizing metals. (K6, 1-73; Zr, Al)

364-K. Welding Copper-Base Alloy Tubes. J. F. Sebald and L. H. Hawthorne. *Power,* June 1958, p. 108-111, 208-214, 218.

(K-general; 4-60; Cu)

365-K. European Solder Developments. M. Reininger. *Product Engineering,* v. 29, June 23, 1958, p. 97, 99. (From *Maschinenmarkt,* no. 92, Nov. 15, 1957.)

A survey of new solders and techniques. (K7; SGA-f)

366-K.* Welding Corrosion Resisting Steels of the 18-8 Cr-Ni Type and Heat Resisting Steels. F. A. Ball. *Sheet Metal Industries,* v. 35, June 1958, p. 439-452.

The background of weld decay and the limitations of the methods developed for its prevention from

metallurgical viewpoint. Procedures for oxy-acetylene welding. 23 ref. (K2h, R-general; SS, 7-51)

367-K. Brazing Filler Metals for High-Temperature Service. A. M. Setapen. *Tool Engineer,* v. 40, June 1958, p. 119-120.

(K8; SGA-f)

368-K.* Titanium Welding Techniques. Titanium Engineering Bulletin No. 6. Titanium Metals Corp. of America, 1958, 31 p.

Welding equipment, shielding arrangement, joint design, preparation and fit-up and recommended weld setting for both inert-gas-shielded metal-arc and inert-gas-shielded tungsten-arc welding processes. Data on stress-relieving; evaluation of weld quality; problems of porosity and cracking; procedure in producing typical weldments; equipment and procedures for spot welding titanium; evaluation of spot weld quality. (K-general; Ti)

369-K. High-Temperature Adhesives. C. N. Powis. *Aircraft Production,* v. 20, Mar. 1958, p. 88-92.

Developments in metal-to-metal bonding for conditions of high-speed flight. (K12)

370-K. Cooperative Investigation of a New Welding Electrode for Stainless Steel. R. D. Wylie. *American Society of Mechanical Engineers,* Paper no. 58-MET-6, Apr. 1958, 8 p.

New welding procedure for use in high-temperature steam piping. 15 ref. (K1a, W13h; SS)

396-K.* Welding Qualification and Component Performance. W. L. Fleischmann. Digest from "ASME-AWS Joint Metals Engineering Conference Paper 58-MET-8". *Mechanical Engineering,* v. 80, July 1958, p. 82.

Specific weld metallurgical problems as they pertain to the weld heat affected zone, weld deposit, joint design, weld quality and weld quality control. Attempts to show that component performance and weldability tests are interrelated and that, in the context of component performance, weldability tests assume the role of simulated service tests. (K9)

397-K.* Bonding Polyethylene to Rubber, Brass and Brass Plated Metals. H. Peters and W. H. Lockwood. *Plastics,* v. 23, June 1958, p. 228-231.

Bonding is now possible through the use of a cement based on partially hydrogenated polybutadiene known as Hydropol. The polymer, compounded with vulcanizing ingredients, is inserted between polyethylene and brass in the form of a thin film. Application of heat and pressure produces a strong vulcanized bond. (K12; Cu-n, NM-d31)

398-K.* Welding Corrosion-Resisting Steels of the 18/8 Cr/Ni Type and Heat-Resisting Steels. F. A. Ball. *Sheet Metal Industries,* v. 35, July 1958, p. 509-522.

Metallic arc, argon-arc, tungsten-arc, submerged arc and resistance welding of austenitic steels. Typical welding conditions and electrode specifications. 27 ref.
(K1a, K1d, K1e, K3; SS)

399-K. Heat Exchangers for Nuclear Power. *Welding and Metal Fabrication,* v. 26, July 1958, p. 234-238.

Welding processes and stress relief of 200-ton pressure vessels.
(W13b, K-general)

400-K. Cupro-Nickel Welded With Aluminum Bronze. Vincent Abaravich. *Welding Journal,* v. 37, Mar. 1958, p. 220-224.

Tests show inert-gas consumable-electrode process eliminates weld-deposit cracking.
(Kd, 9-72; CU-s, Al)

401-K. An Old Welding Process Cheats the Sea. L. L. Walker, Jr. *Welding Journal,* v. 37, Mar. 1958, p. 225-230.

Oxy-acetylene welding in the reconditioning and rebuilding of magnesium-bronze marine propellers.
(K2g, T22h, 17-72; Cu-s, Mg)

402-K.* Ultrasonic Welding of Structural Aluminum Alloys. J. Byron Jones and Florence R. Meyer. *Welding Journal,* v. 37, Mar. 1958, p. 81s-92s.

Ultrasonic spot and seam welding and their possibilities with the aircraft structural Al alloys. Tensile-shear and metallographic studies were made to determine the strength of the welds. Ultrasonics makes surface cleaning less critical and sometimes requires only degreasing. Supplemented with resistance heating, ultrasonic spot-type welders can cover a wider range of metal thickness. 4 ref.
(K3n, K3p, 1-74; Al-b)

403-K.* Energy Absorption Studies of Welds in Tempered Martensitic Base Metal. W. H. Bruckner and C. A. Robertson. *Welding Journal,* v. 37, Mar. 1958, p. 97s-100s.

Tempered-martensite base metal provides a larger energy-absorption potential than is available from conventional structural steel of rimmed or killed grades. Tests indicate that the heat affected zone of tempered-martensitic base metal is only slightly lower in energy absorption and ductility than the initial metal. The use of a welded crack stopper of this steel in a rimmed steel would arrest the propagation of a brittle crack since the energy absorbing capacity increases across the weld into the weld interface and into the martensitic base metal. (K9n; ST)

404-K.* Inert-Gas-Shielded Consumable-Electrode Welding of Molybdenum. N. E. Weare, R. E. Monroe and D. C. Martin. *Welding Journal,* v. 37, Mar. 1958, p. 117s-124s.

Arc stability and metal transfer are improved by using d-c, straight polarity, an electrode wire coated with a compound to increase the emission of electrons, and a helium shield. Same conditions produced best weld-bead contour, and lessened weld-metal cracking from shrinkage stresses developed in the weldment.

Porosity was eliminated by using either a leading-trailing shield or a dragging shield. Test results indicated that welding process may best be applied to weld thick Mo plate, whereas tungsten-arc welding would be better for welding sheet ⅛ in. thick or less. 7 ref.
(K1d, K1g; Mo, 4-53)

405-K.* Spot Welding of Inconel "X" in Thickness Range of 0.032 to 0.188 Inch. Jean Harris, M. D. Bellware and J. J. Riley. *Welding Journal,* v. 37, June 1958, p. 570-578.

Welding schedules for spot welding sheets of Inconel "X". Weld quality meets requirement of MIL-W-6858A specifications. Influence of thickness, welding and forging pressures, weld, quench and temperature times and welding current on weld strength and soundness. Results indicate satisfactory welds can be made on either single phase or three-phase equipment. 4 ref.
(K3n, 2-61, 3-74; Ni-b, 4-53)

406-K.* Porosity in Aluminum-Alloy Welds. F. R. Collins. *Welding Journal,* v. 37, June 1958, p. 589-593.

Effects of gas in Al plate, gas in electrode, shielding gas composition and welding conditions on porosity of welds made in Al using inert gas shielded consumable electrodes arc and inert gas shielded tungsten arc processes. Atmospheric contamination of shielded gas during welding was greatest source of porosity in inert gas shielded consumable welds. Excessive gas in plate or electrode contributed to porosity; however, commercial alloy did not contain sufficient gas to substantially effect porosity. Al-Mg alloys gave lower weld porosity than Al-Si alloys. 4 ref. (K9n; Al-b, 9-68)

407-K.* Electrode-Tip Life Studies in Series Spot Welding. E. F. Nipples, W. F. Savage, S. M. Robelotto and K. E. Dorschu. *Welding Journal,* v. 37, June 1958, p. 241s-248s.

Investigates the effect of electrode geometry, electrode material, electrode force and welding current on weld strength, weld diameter, weld consistency and electrode life for serious spot welds in as-received auto-body stock. Optimum welding condition for cold rolled rimmed steel body stock in pickled and lightly oiled condition of 0.036 to 0.039 in. thicknesses. Welding conditions which do not produce flashing provide more consistent welds than conditions which cause flashing. Consistency of welds made with 2 in. continuous radius dome electrode superior to those with 5/16 in. continuous radius dome electrodes.
(K3g, K9r, W29h; ST)

408-K.* Bonding of Cermet-Valve Components to Metals. G. M. Slaughter, P. Patriarca and W. D. Manly. *Welding Journal,* v. 37, June 1958, p. 249s-254s.

Technique and procedures for brazing cermets of the cemented carbide type of Inconel for high-temperature service. Cermets contained varying percentages of titanium carbide, tungsten carbide, tungsten-titanium complex carbide or columbium-tantalum-titanium complex carbide with Ni or Co as binding material; wetting tests with different brazing alloys; microstructure of bonds. Use of Ni for alloy cushions between cermet and Inconel to reduce effects of stresses resulting from differential thermal expansion; high-temperature direct bonding procedure for joining titanium carbide nickel cermets to Ni without brazing alloy. 8 ref. (K8; Ni-b, 6-70)

409-K.* The Arc Welding of Wrought Magnesium-Thorium Alloys. L. F. Lockwood and Paul Klain. *Welding Journal,* v. 37, June 1958, p. 255s-264s.

Results of welding evaluation tests on wrought Mg-base Th-containing alloys. HK31A, HM21XA, HM31XA. Tests with inert gas shielded tungsten arc process indicated alloys possessed excellent weldability and good short-time high-temperature properties after welding. Weld strength closely approached that of base metals at elevated temperatures. Creep resistance was not adversely effected by welding. Post weld heat treatments did not improve weld strength. Corrosion rates in 3% sodium chloride were not changed significantly by welding. EZ33A alloy found to be best rod composition for all alloys except certain applications at temperatures above 600° F. 4 ref. (K1d; Mg, Th)

410-K.* Chlorine Additions for High-Quality Inert-Gas Metal-Arc Welding of Aluminum Alloys. M. B. Kasen and A. R. Pfluger. *Welding Journal,* v. 37, June 1958, p. 269s-276s.

Introduction of small amounts of chlorine into arc area permits radiographically clear flat-position inert gas metal arc welds to be produced in Al alloys containing Mg despite presence of large amounts of gaseous contamination in the arc area. Chlorine introduced in torch contact tube at rate of 10 cubic

cm/mm. Effective in preventing porosity and removing dross resulting from oxygen, hydrogen, propane, water vapor hydrated oxide and welding wire contaminations. (K1d; Al, Mg, Cl)

411-K. (Czech.) **Welding Technique Development in USSR.** Julius Zeke. *Zvaranie,* v. 7, no. 5, May 1958, p. 129-135.

State of automatic welding in USSR as found on study tour of various plants and institutions. (K-general)

428-K. Automatic Welding Simplifies Design and Fabrication of High Pressure Cylinder. E. E. Martinac. *Modern Machine Shop,* v. 31, June 1958, p. 148-150.

A butt weld in a 4-in. thick steel cylinder fabricated in the maintenance shop of the Lincoln Electric Co. solved a design problem.
(K1e, 17-51; ST)

429-K. Investigation of Residual Stresses Resulting From Submerged Automatic Welding. L. A. Glikman and A. N. Babaev. *Metallovedenie i Obrabotka Metallov,* May 1958, p. 31-37. (Henry Brutcher, Altadena, Calif., Translation no. 4221.)

In the surface layer of axial and tangential welding the residual stresses are in tension. They seem to be about 55 kg. per sq. mm. which roughly corresponds to the elastic limit of the fused metal. In the interior of the weld the stresses are considerably less. Maximum axial stresses are induced by parallel welding and minimum by circular. The greatest tangential stresses are produced by circular and the minimum by longitudinal welding. Preheating at 200° C. is helpful in keeping residual stresses down, but definite improvement is obtained by preheating to about 300° C.

Use of a holder with invariable frequency in electrode welding has no effect on porosity decrease in root welding in difficult positions. (K9r, K1, 9-68)

456-K. (Czech.) **Factors Involved in Argon Shielded Welding With Consumable Electrode.** Pavel Zuffa. *Zvaranie,* v. 7, June 1958, p. 179-180.

Dependence of current on rate of wire feeding; possibility of raising upper current limit; formula for approximate calculation of the welding current from wire feeding rate. (K1d, K9)

457-K. (Czech.) **Testing Soldering Qualities of Solders.** Viliam Ruza. *Zvaranie,* v. 7, June 1958, p. 181-183. 5 ref. (K7, K8; SGA-f)

458-K. (French.) **Vacuum Welding of Metals.** J. A. Stohr and J. Briola. *Soudage et Techniques Connexes,* v. 12, May-June 1958, p. 165-172.

Welding process recently developed by the Commissariat a l'Energie Atomique, in which use is made of the impact of an electron beam produced by an electron gun to melt the edges of the workpieces. Welding is carried out in a metal enclosure, in a vacuum of 10^{-4} to 10^{-6} mm. of mercury. Process makes it possible to weld highly oxidizable metals (e.g., Zr) or to fabricate high-vacuum-sealed metal containers. (K1d, 1-73)

459-K. (German.) **Inert-Gas-Shielded Arc Welding and Cutting of Aluminum.** W. Linieus. *Industrie-Anzeiger,* v. 80, June 27, 1958. p. 746-749. 8 ref. (K1d, G22h; Al-b)

468-K. (Russian.) **Weldability of Heat Resistant Pearlite Steel Rotors.** M. Kh. Shorshorov and V. N. Matkhanov. *Svarochnoe Proizvodstvo,* June 1958, p. 18-23.

It is recommended that welding temperature be kept within range 660-680°. 5 ref. (K9s, ST, SGA-h)

469-K.* **A Photoelastic Technique for Strain Measurement on the Aluminum Alloy Surfaces.** H. Fessler and D. J. Haines. *British Journal of Applied Physics,* v. 9, July 1958, p. 282-287.

Technique for bonding layers of an epoxy resin on flat Al alloy surfaces. Joints which withstood more than 4% strain were obtained by carefully controlled preparation of the metal and the adhesive. Initial birefringence was avoided by curing the joint without external pressure and by slow cooling after finish curing at 65° C. Different types of reflection polariscopes; strain fringe values for reflecting layer

and adhesive estimated. (K11d; Al-b, NMd-30)

470-K.* **Some Applications of Cold Pressure-Welding.** *Machinery (London)*, v. 93, July 23, 1958, p. 207-213.

Preparation of the mating surfaces and of four different types of lap-welded joint, also of manually and pneumatically operated tools available for this process. (K6)

471-K.* (Russian.) **Effect of Welding Conditions on Hydrogen Content of Weld Metal.** R. A. Kozlov. *Svarochnoe Proizvodstvo*, Apr. 1958, p. 25-28.

Study of hydrogen in metal which causes cracks and other flows in welding process. In automatic welding, content of hydrogen in weld metal depends on welding procedure, type of current and grade of flux and temperature of annealing. In manual welding, the temperature for firing the electrode is basic factor influencing the lowering of hydrogen content in the fused metal. 5 ref. (K1, 2-61, 2-64; H, 7-51, 9-72)

472-K.* **New Concept Solves Aluminized Pipe Weld Problems.** Kenneth R. Notvest. *Petroleum Refiner*, v. 37, July 1958, p. 100-102.

Inert gas welding controlling the fusion of aluminized base metal with the filler metal to give an alloyed root pass, which is fused to the base metal coating, provides continuous protection from corrosion of Al. (K1e, 4-61, 8-74)

473-K.* (German.) **Experience With Argon Protected Sigma Hard Facing and in Carbon Dioxide Joint Welding.** R. Nass and E. Brammertz. *Werkstatt und Betrieb*, v. 91, June 1958, p. 297-305.

Apparatus, technique and results in facing sheet steel with Cu alloy under argon protection and in welding thick sheet under carbon dioxide protection. Acceptance testing in carbon dioxide sigma welding applied to boiler construction. Investigation on toxic effect of carbon dioxide. 4 ref. (K1d, L24; ST, 4-53)

474-K.* (German.) **Ultrasonic Welding.** W. Weber. *Werkstatt und Betrieb*, v. 91, June 1958, p. 305-310.

Principle; comparison with high pressure welding; best modern construction of weld units; controlled operation variables; recrystallization welding; mechanism of ultrasonic welding; thermal conditions in weld zone; properties of welded material; applications. 10 ref. (K6r)

475-K.* (German.) **Effect of Hydrogen in Steel Hardening and Welding.** K. L. Zeyen. *Werkstatt und Betrieb*, v. 91, June 1958, p. 310-320.

Effect of hydrogen in hardening and methods to measure it; effect of hydrogen in welding; effect of humidity of electrode coats and of welding method. Recent publications on basic coated electrodes and advantages of the latter. 100 ref. (K1, ST; 9-72, 10-54)

476-K.* (German.) **New Method of Arc Butt Welding of Rails.** Ott and Krause. *Schweisstechnik*, v. 12, May 1958, p. 51-58.

Development and technique of method; quality of weld; economical advantages; testing and mechanical properties of weld. (K1, T23q)

477-K. **Grit and Shot-Reinforced High-Tensile Bolted Joints.** R. L. Sanks and C. C. Rampton, Jr. *American Society of Civil Engineers, Proceedings*, v. 83, Nov. 1957, 32 p. (National Advisory Committee for Aeronautics Technical Note 1435.)

Paint in high tensile bolted joints drastically reduces frictional resistance to slip. Shot-reinforced painted joints are, in static tests, equal to or somewhat better than clean mill-scale joints, and much superior to riveted joints. (K13p)

478-K. **High-Temperature Corrosion-Resistance Brazing.** John V. Long and George D. Cremer. *Astronautics*, v. 3, Aug. 1958, p. 28-29.

9 ref. (K1d, K3p, T26q; ST)

488-K. (German.) **Welding of Alloy-Steels in the Chemical Industry Without Pre-Heating.** Werner Gilde. *Schweisstechnik,* v. 12, June 1958, p. 84-87.

Slow cooling to hold the temperature of the weld zone for a brief time at the solidification temperature. 8 ref. (K9q, K9r; ST)

489-K. (German.) **Automatic Submerged-Arc Welding of Thin Plates.** Horst Buszka. *Schweisstechnik,* v. 12, June 1958, p. 87-91.

Mechanical properties of joints; description of equipment.
(K1e, 3-73, 18-74; ST, 4-5)

490-K. (Russian.) **Stresses in Thin Sheet Elements in Welding and How to Avoid Them.** S. A. Kurkin and V. A. Vinokurov. *Svarochnoe Proizvodstvo,* Apr. 1958, p. 28-31.

Recommends rolling of ring-shaped seams and pressure on spots in spot welding to eliminate stresses. 5 ref.
(K3n, Q25h, 3-74, 17-51; 4-53, 7-51)

491-K. Report on Adhesive Bonding of Titanium. H. E. Pattee, G. E. Faulkner and P. J. Rieppel. *Battelle Memorial Institute, TML Report no. 104,* 1958, 28 p.

Considers metal-to-metal adhesive bonding and its applications. Adhesives, surface treatments, production consideration and evaluation of bonded structures. 85 ref. (K12)

492-K.* High Quality Fusion Welding of Aluminum. T. B. Correy. *Light Metal Age,* v. 16, June 1958, p. 8-12.

Methods for arc welding Al. A thin section of annealed 1100 alloy (2-S), Alcoa A-13 alloy braze, and a thick section of annealed 1100 alloy were fusion welded by a capacitor balanced inert-gas shielded, tungsten electrode, alternating current arc process. Result was a weld of laboratory quality with smooth, shiny surface, devoid of porosities, pipes and inclusions, highly corrosion resistant and water-tight, with uniform cross section and penetration. (K1; W29d; Al)

493-K.* The Meaning of Weldability. T. B. Jefferson. *Welding Engineer,* v. 43, Mid-June, 1958, p. 5-20.

Weldability and data on chemical composition, mechanical properties, physical properties of low, medium and high-carbon steels, low-alloy high-sulphur steels, low-alloy Mn steels, low-alloy Ni steels, low-alloy Ni-Cr steels, low-alloy Mo steels, low-alloy Cr steel, low-alloy high-tensile steel, austenitic stainless steels, martensitic stainless steels, ferritic stainless steel, austenitic Mn steel. Al, Al alloys, Mg, Mg alloys, Cu, brasses, bronze, Cu-Si, Cu-Ni, aluminum bronze, B-Cu, phosphorus bronze, Ni and Ni alloys. (K9s; CN-g, CNr, AY, b, SS, Al, Mg, Cu, Ni)

494-K.* Welding Titanium. Karl Bungardt and Klaus Rudinger. *Metal Progress,* v. 74 July 1958, p. 184-185. Digest of "A Contribution to the Problem of Welding Titanium Alloys". ("Zeitschrift für Metallkunde", v. 47, Aug. 1956, p. 585-593.)

A post weld anneal is recommended for all alloys (1 hr. at 1290° F.) to reduce residual stresses and improve notch toughness. Section thickness of the weldment affects the length of time required at the temperature. Weldments made up of both alpha and alpha + beta Ti alloys exhibit superior properties. (K-general, J1a; Ti-b)

495-K.* Cyclic Strength Tests on Solders. Influence of Cerium. *Tin and Its Uses,* no. 42, Spring 1958, p. 14-16.

Cyclic loading at 250° F. of joints soldered with 70Sn-30Pb and 30Sn-70Pb solders containing up to 0.50% cerium demonstrated marked superiority of the high tin solder and further improvement of performance of the high tin solder with addition of cerium. (K7; Sn, Pb, Ce)

496-K.* Inert-Gas Tungsten-Arc Welding of Titanium for Nuclear and Chemical Industries. G. M. Adamson and W. J. Leonard. *Welding Journal,* v. 37, July 1958, p. 673-682.

Process by which unalloyed Ti may be field welded using only conventional inert-gas tungsten-arc equipment. The process is applicable to the high-quality individual welds required in field welding for the chemical industry rather than to high-speed repetitive production welds. (K1d, T29; Ti)

497-K.* Fundamentals of Brazing for Elevated-Temperature Service. M. D. Bellware. *Welding Journal,* v. 37, July 1958, p. 683-691.

Classifications of the brazing alloys considered are silver-base, copper-base, manganese, gold and palladium-base and nickel-base. For service temperatures above about 1000° F., Ni-base brazing alloys have produced the best results. When brazing alloys in the form of fine powder are used, they are often mixed with a suitable vehicle such as acrylic-resin or methyl-cellulose. These binders leave practically no residue after brazing. 9 ref. (K8, 2-62; Ag, Cu, Mn, Au, Pd, Ni)

498-K.* Prediction of Weld Heat-Affected Zone Microstructures From Continuous-Cooling Transformation Data. E. F. Nippes and E. C. Nelson. *Welding Journal,* v. 37, July 1958, p. 289s-294s.

A system of predicting the microstructures of the heat affected zones of welds from continuous cooling transformation data and weld thermal cycles. Microstructures of experimental welds are compared with the predicted microstructures, and the system of calculations and its experimental foundations are analyzed to explain the differences between theory and actual welds. 6 ref. (K9, M27)

499-K* Welding Metallurgy of Cr-Mo-V Steels for High-Temperature Steam-Turbine Components. R. J. Christoffel, R. M. Curran, F. H. Domina and C. H. Soldan. *We'ding Journal,* v. 37, July 1958, p. 295s-303s.

Summary of preheat and post-weld heat treatments developed for welding Cr-Mo-V base metal with a ½% Cr-1% Mo electrode using both the manual metal-arc and submerged-arc processes. Rupture strength of the ½% Cr-1% Mo weld metal was evaluated and found to be less than that of the base metal. The effect of composition and heat treatment on the rupture strength of low-alloy steel weld metals was evaluated. 7 ref. (K1, W11k, J1a; ST, Cr, Mo, V)

500-K.* Fabrication and Service Factors Involved in Failure of Welded Steam Receivers. A. J. Babecki and P. P. Puzak. *Welding Journal,* v. 37, July 1958, p. 320s-325s.

Base-metal cracking in the vicinity of the nozzle and manhole reinforcement pads was discovered in 65-in. diameter catapult steam receivers aboard naval aircraft carriers after 1 to 1½ yrs. of service. Fabrication defects in the form of porosity, undercutting and poor fit-up were found in all three receiver sections. Typical fatigue-type markings of crack propagation were found on the crack surfaces emenating from weld-metal porosity. (K9, 9-68, 9-72)

501-K.* Low Crack Sensitivity of Steel Joint Welded by CO_2-O_2 Arc Welding. H. Sekiguchi and I. Masumoto. *Welding Journal,* v. 37, July 1958, p. 326s-336s.

A mixed gas of carbon dioxide and oxygen is supplied around the arc and molten pool and a bare steel wire containing suitable quantities of deoxidizers is used as a metal electrode. Results of measurements on hydrogen contents and crack sensitivities of steel joints are given. Hydrogen content of the weld is very low in comparison with those by other processes. 10 ref. (K1d; ST)

502-K.* Joining Problems Aired. J. L. McCloud. *Metal Progress,* v. 74, July 1958, p. 93-96.

Serviced requirements for metal assemblies used in jet and rocket engines and in atomic applications are becoming more stringent. This has focused attention on improved methods for brazing and welding metals for high-temperature service. (K-general)

503-K.* Role of Phosphorus in Austenitic Manganese Weld Metal. W. T. Delong, W. L. Lutes and H. F. Reid. *Welding Journal,* v. 37, July 1958, p. 316s-319s.

Nickel-manganese weld metals with reduced phosphorus contents in the range 0.01 to 0.02% had outstanding tensile strength, ductility and crack resistance. Phosphorus contents of about 0.035% appeared the maximum that could be tolerated without impairment of the properties of the weld deposit. General response of Mo-Mn weld metals to reduction of phosphorus content paralleled those observed in Ni-Mn weld metals. 7 ref. (K9, 2-60; SS, *P, Ni, Mn*)

504-K. Development of Oxidation and Liquid Sodium Resistant Brazing Alloys. D. A. Canonico and H. Schwartzbart. Armour Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131745, Mar. 1958, 44 p. $1.25.

Development of filler metals for brazing Type 310 stainless steel to Inconel, resistant to oxidation and attack by molten sodium at 1650° F. (K8; SGA-f, Fe-b, Cr-b, Ni-b, SS)

505-K. The Production Man's Guide to Adhesive Bonding Methods. John P. Wright. *Metalworking Production,* v. 102, Aug. 1, 1958, p. 1352-1358. (K12, K11)

506-K. Arc Versus Gas Welding on Gray Cast Iron—Which Should It Be? Jose Carlos Pellegrino. *Welding Engineer,* v. 42, July 1958, p. 48. (K1a, K2g; CI-n)

507-K. Selection, Welding of CrMo Alloy Steel Pipe. Jay Bland. *Welding Engineer,* v. 43, July 1958, p. 34-36. (K1, 4-60; AY, *Cr, Mo*)

508-K. Welding and Stainless Maintain Water Turbines. Lloyd McWilliams. *Welding Engineer,* v. 43, July 1958, p. 38-40. (K1, T7h; SS)

509-K. Improving the Fatigue Life of Spot Welds. *Welding Journal,* v. 37, July 1958, p. 315s-336s.

Increase of fatigue life through stress distribution in hydrodynamically compressed spot welds. (K3n, Q7)

510-K. How Good Is Your Welder Power Supply? A. C. Johnson and F. E. Donathan. *Welding Journal,* v. 37, July 1958, p. 692-699.

Simple electronic counter developed to indicate the frequency with which excessive voltage drops occur. (K-general, W29a)

511-K. Design Tips for Dry Hydrogen Brazed Parts. H. Lewis. *Western Metalworking,* v. 16, June 1958, p. 23-26. (K8, K6q, SGA-f, 17-51)

512-K. (German.) **Wiping Solder in Manufacture of Motor Car Bodies and in Cable Joining.** H. Johnen. *Schweissen und Schneiden,* v. 10, July 1958, p. 281-283.

Wiping operation; determination of wiping temperature and properties; suitable solders. (K7a, T21a, T1b; SGA-f)

513-K. Improvement of Quality of Weld Metal. A. A. Alov and V. S. Vinogradov. *Svarochnoe Proizvodstvo,* July 1957, p. 9-10. (Henry Brutcher, Altadena, Calif., Translation no 4116.)

Effect of transverse electrode vibration during welding (submerged arc) on the impact strength of the weld metal. (K1e, K9r)

514-K.* Helpful Hints for Successful Brazing. Orland Jack. *Carbide Engineering,* Aug. 1958, p. 9-12.

Brazing techniques for carbide tool tips; cleanliness, care, accuracy essential for successful joints. (K8, T6n; 6-69)

515-K.* Industrial Applications of Magnetic-Flux Gas-Shielded Arc Welding. R. T. Telford and F. T. Stanchus. *Welding Journal,* v. 37, Aug. 1958, p. 771-778.

Process has several advantages compared to covered-electrode welding: up to an 80% reduction in costs; up to a 400% increase in welding speeds; excellent weld quality, mechanical properties, appearance and lack of undercutting. Use of magnetic-flux welding for root and backing passes as preparation for submerged-arc welding improves weld quality and cuts costs. (K1d, K1e)

516-K.* Inert-Gas-Shielded Arc Welding of Silicon and Aluminum

Bronze. Paul L. Hemmes. *Welding Journal,* v. 37, Aug. 1958, p. 779-788.

Joint design, welding procedures, shielding gas, operational techniques and mechanical strength of welded joints. In most applications the inert-gas-shielded arc-welding processes are most efficient for welding both silicon and aluminum bronze. (K1d; Cu-n, *Si, Al*)

517-K.* Casting Weldments in a Petroleum Refinery. J. Bland, C. B. Parrish and R. C. Wheeler. *Welding Journal,* v. 37, Aug. 1958, p. 789-798.

Weldability characteristics of low and intermediate Cr-Mo alloy steels. Castings which meet specification requirements for chemistry and tensile properties, in addition to being virtually free from casting defects, are satisfactory components of petroleum refining equipment and process lines. Typical examples of repair and maintenance. (K9s, T29n, 17-57; AY, 5-60)

518-K.* Diffusion Bonding Below 1000° F. J. T. Niemann, R. P. Sopher and P. J. Rieppel. *Welding Journal,* v. 37, Aug. 1958, p. 337s-342s.

Diffusion-bonding techniques for joining Be-Cu and Monel. Good joints were obtained with Au-Cu, Au-Ag, Au-Pb and Au-Al combinations. From the standpoint of strength, Au-Cu and Au-Ag were comparable (13,000 psi. shear) and superior to the Au-Pb and Au-Al combinations which were found to be quite brittle. 5 ref. (K5k; Cu-b, Ni-b, SGA-f)

519-K.* Control of Melting Rate and Metal Transfer in Gas-Shielded Metal-Arc Welding. Pt. 1. Control of Electrode Melting Rate. A. Lesnewich. *Welding Journal,* v. 37, Aug. 1958, p. 343s-353s.

Melting rates of electrodes having a fixed composition using the gas-shielded metal arc with reverse-polarity direct current are dependent only upon the welding current, electrode extension and electrode diameter. Heat for electrode melting is developed by anode or cathode reactions and electrical-resistance heating. Very little, if any, heat is due to radiation from the weld pool or the arc stream. 9 ref. (K1d, K9n)

520-K.* The Control of Porosity in High-Nickel Alloy Welds. G. R. Pease, R. E. Brien and P. E. Legrand. *Welding Journal,* v. 37, Aug. 1958, p. 354s-360s.

Tests were conducted to establish what gases will cause porosity and in what amounts they are damaging. Nitrogen was found to be extremely damaging to the weld soundness of Cr-free alloys; oxygen, carbon monoxide and carbon dioxide were less so and hydrogen was relatively innocuous. Cr-containing alloys were more resistant to damaging effects by all the gases. The addition of Ti and other gas-fixing elements to the weld deposit increases the breadth of the welding conditions under which porosity-free welds can be prepared. 17 ref. (K9r, 9-68; Ni-b)

521-K.* The Effect of Welding Speed on Strength of 6061-T4 Aluminum Joints. William L. Burch. *Welding Journal,* v. 37, Aug. 1958, p. 361s-367s.

6061-T4 aluminum joints could be welded by the inert-gas-shielded tungsten arc process, which upon aging had nearly the strength of 6061-T6. Welding speed was the most important of the many factors affecting response to aging. Slow speeds caused high heat input, practically annealing the base metal. With increasing speeds the joint strength increased rapidly up to a speed of 15 in. per min. above which the tensile strength was uniformly high at 90-95% of T-6 strength. 5 ref. (K1d, Q27d; Al-b)

522-K.* (French.) **Use of Gas for Brazing.** *Pratique des Industries Mecaniques,* v. 41, Apr. 1958, p. 92-95.

Gas brazing techniques and equipment. (K8g, 1-52)

523-K.* (Russian.) **Electrode Wires for Welding in Carbon Dioxide Gas.** N. M. Novozhilov and A. M. Sokolova. *Svarochnoe Proizvodstvo,* July 1958, p. 10-14.

For welding low-carbon steels in CO_2 gas it is recommended that electrode wires contain Si and Mn as deoxidizers. For welding of rimming and killed low-carbon steels at 500 amp. the electrode wires should contain 0.05-0.12% C, 0.6-1.0% Si and 1.4-2.4% Mn. This composition can also be used for other low-carbon steels. Addition of Cr, Ni, Mo and Cu will produce welds of many different properties. 13 ref. (K1, W29h; CN, ST-c, ST-d)

524-K.* (Russian.) **Strength of Various Types of Titanium Welds.** F. E. Tret'yakov and G. E. Kainova. *Svarochnoe Proizvodstvo,* July 1958, p. 19-23.

The wear resistance of spot and roll welds subjected to high-frequency stress is very low. The strength of spot and roll welds subjected to cyclical stress at a raised temperature declines more slowly than that of the base metal. The strength of two-layer spot welds is much greater than that of single layer welds under static stress and low-frequency cyclical stress. (K9r, Q9n, Q27a; Ti-b, 7-51)

525-K.* (Russian.) **Fuzing of Brass on Steel Products by Gas Flame.** I. A. Nenaezdnikov. *Svarochnoe Proizvodstvo,* July 1958, p. 35-38.

Causes of crack formation when fuzing brass on carbon steel as well as on Ni-Cr-Mo steels of 22-24-mm. thickness used in shipbuilding. Heating of complex shapes to 900-950° before fuzing results in largest number of cracks. More cracks form on alloy than on carbon steel. Absence of cracks in fuzed brass layers is to be explained by its high plastic qualities in the process of crystallization. Varying temperature with different shapes and sizes will minimize cracks. (K2h, 9-72; Cu-n, CN, SS)

526-K.* (French.) **Arc Welding.** Victor Caron. *Ingenieur,* v. 44, Summer 1958, p. 9-11.

Thermal and metallurgical principles and phenomena. (K1)

527-K. (English.) **Some New Resistance Welding Machines of Czechoslovak Manufacture.** Mario Benes. *Czechoslovak Heavy Industry,* no. 5, 1958, p. 2-8.

(K3, 1-52)

528-K. (English.) **Several Interesting Examples of Resistance Welding Applications Used in the Czechoslovak Industry.** Ladislav Pliva. *Czechoslovak Heavy Industry,* no. 5, 1958, p. 9-15.

Application of spot, seam or flash welding in joining low-carbon steel for concrete reinforcement; welding sheet steel for automobile body component, joining thin steel wire, welding Cu to Al and producing motorcycle rims. (K3; ST, Al, Cu)

529-K. (English.) **Czechoslovak Automatic and Semi-Automatic Submerged Arc Welders.** Miloslav Pavlasek and Miroslav Duben. *Czechoslovak Heavy Industry,* no. 5, 1958, p. 17-27.

(K1e, 1-52)

530-K. (English.) **Automatic Welding of Boiler Stays Under Flux.** Adolf Turek and J. Lukasek. *Czechoslovak Heavy Industry,* no. 5, 1958, p. 28-31.

Joining steel stays to boiler wall by means of automatic submerged arc welding. (K1e, T26q)

531-K. Silver Brazing Gives High-Strength Joints. *Metalworking,* v. 14, July 1958, p. 10-11.

(K8j; Ag)

532-K. How to Calculate Stresses in Adhesive Joints. H. A. Perry. *Product Engineering,* v. 29, July 7, 1958, p. 64-67.

(K12, Q25k)

533-K. (Russian.) **Weldability of Ferrite-Austenitic Steels.** I. A. Zaks. *Svarochnoe Proizvodstvo,* July 1958, p. 5-10.

Experiments with welding of high-strength corrosion resistant steels with minimum yield point of 40 kg. per sq. mm. Exposure for 2-3 hr. at 650-850° greatly increases corrosion resistance. 7 ref. (K9s, R-general; SS)

534-K. (Russian.) **Welding of Turbine Martensite Steel.** G. A. Nikolaev and A. V. Mordvintseva. *Svarochnoe Proizvodstvo,* July 1958, p. 1-5.

Experiments show possibilities of welding turbine sections of high-alloy martensitic steel in protective medium. 4 ref. (K1d, W11m; SS-c)

535-K.* Shrink-Fitting by Stress Relief. A. Peiter. *Engineers' Digest,* v. 19, July 1958, p. 305-307.

Relief of internal stresses in a quenched steel ring causes it to contract. This principle used to obtain shrink-fitting of rings on shafts. 4 ref. (K13r)

536-K.* (German.) **Adhesive Bonding of Metals, a New Joining Method.** H. Rebeski. *Werkstattstechnik und Maschinenbau,* v. 48, June 1958, p. 302-306.

The bonding of thin sheet metal in the outer skin of an airplane wing. The joints are riveted after bonding, then the skin is tightened around the wing with the help of a special fixture giving the upper wing an initial stress to prevent folds. Since the adhesive should not harden during these operations, a thermosetting cement is used and hardened afterward by heat. Other required properties of the adhesive are resistance to peeling, weathering and changes in temperature. (K12, T24a; NM-d30)

537-K. Soldering of Uranium. G. S. Hanks, D. T. Doll, J. M. Taub and E. L. Brundige. *U. S. Atomic Energy Commission TID-8018*, 1958, 15 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Joining of uranium to uranium using a number of commerical soft solders and fusible alloys. Ultrasonic soldering iron has proved the best method for joining U to itself and to other metals, such as stainless steel. The soldering characteristics of U may best be compared to those of Al. (K7; U)

538-K. Welding Thin-Walled Uranium Cylinders. E. L. Brundige, J. M. Taub, G. S. Hanks and D. T. Doll. *U. S. Atomic Energy Commission TID-8019*, 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D.C.) $.50.

Inert-gas shielded-arc method without filler metal gave uranium welds free from porosity, cracks and oxide inclusions. Tensile strength and yield strength exceeded the strength of cast metal. Surface condition and purity of the inert-gas used affected weld soundness. Straight polarity direct current was used to achieve maximum penetration and to provide arc stability. (K1d; U)

539-K. LC Welding—It's Really Cool. *Canadian Metalworking*, v. 21, Aug. 1958, p. 24-26.

"LC" arc welding system deposits conventional flux-covered electrodes, and while so doing, drains resistance heat out of the electrodes as they are being consumed by the arc and converted into weld metal. (K1a)

540-K. Evaluation of Spot Welds Made Through Primers and Sealers. B. A. Schevo. *Welding Journal*, v. 37, Aug. 1958, p. 799-802.

Primers and sealers were found to have no detrimental effect on the weld strength when welding was performed in accordance with proper procedure. (K3n, K9r)

541-K. Current Welding Research Problems. *Welding Journal*, v. 37, Aug. 1958, p. 379s-384s.

List was made to inform Welding Research Council project committees and university research workers of some of the more important problems facing industry. Suggestions come largely from engineers, scientists and executives of American industry and government agencies. (K-general, A9)

542-K. (Italian.) **Submerged Arc Welding Machines. Pt. 1.** Oscar Grossi. *Ingegneria Meccanica*, v. 7, Jan. 1958, p. 61-66; Feb. 1958, p. 7-15.

(K1e, 1-52)

544-K. (Book.) **Handbook of Fastening and Joining of Metal Parts.** Vallory H. Laughner and Augustus D. Hargan. 622 p. 1958. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $15.

Screw and pipe threads; screws, bolts and nuts; locking nuts, washers and retaining rings; riveting, setting and staking; gas, arc and thermit welding; brazing and soldering; adhesives and adhesive-bonded joints. (K-general)

545-K. (Book.) **Elevated Temperature Properties of Weld-Deposits and Weldments.** 228 p. 1958. American Society for Testing Materials, STP 226. Special Technical Publication, 1916 Race St., Philadelphia 3, Pa. $5.50.

Elevated temperature data on steels and similar alloys as presented by current good welding practice.
(K1, Q-general, 2-62; SS, ST, 7-51)

546-K.* Gas Shielded Self-Adjusting Arc Welding as Applied to Steels. H. Levinsohn. *New Zealand Engineering*, v. 13, July 15, 1958, p. 273-278.

Control, efficiency of shielding with argon, helium and CO_2, with and without O_2 added, on stainless steels. (To be continued.)
(K1d; SS)

547-K. Joining and Inspection of Joints. J. C. Herr. Paper from "Sheet Materials for High Temperature Service", American Society for Metals, 1958, p. 69-74.

Problems of brazing, welding and bonding of stainless steel, Ti, Mg and Al alloys. Inspection techniques include X-ray, fluoroscopy and ultrasonics.
(K-general, S13; SS, Ti, Mg, Al)

548-K.* (German.) **Repair Welding Cast Iron Ingot Molds.** Karl Petschauer. *Giessereitechnik*, v. 4, June 1958, p. 125-128.

Cast iron ingot molds used in steel mills frequently crack due to

the extreme stress developed. In preparation for repair the erosions are cleaned to the bare metal and the cracks are widened. This may be done with oxy-acetylene process or arc welding using carbon electrodes. Test results show Brinell hardness 110-205 and structural strength 14.2-24.5 kg. per sq. mm. (K1h, K2h, W19c; CI, 18-72)

549-K.* (French.) **Welding Chromium-Molybdenum Steel.** Paul De Marneffe. *Revue de la Soudure,* v. 14, no. 2, 1958, p. 67-73.

Welding methods for Cr-Mo steels used in the construction of oil refineries. Homogeneous welding usually is not possible because the complicated forms and large dimensions preclude subsequent heat treatment. Heterogeneous welding with austenitic electrodes appreciably decreases stress due to contraction and does not change the composition of the steels. Austenitic electrodes depositing a steel with mixed microstructure containing some ferrite show less cracks. Completely austenitic steels perform better in spite of the presence of some microcracks, which may even be helpful in reducing stresses. (K1; AY, SS, *Cr, Mo*)

550-K.* (French.) **Problem of Cracking in Austenitic Stainless Steel Welding.** Jean Sebille. *Revue de la Soudure,* v. 14, no. 2, 1958, p. 91-118.

Types and origin of cracks; structure; intergranular constituents; dendrictic segregation problem; chemical components, including Cb, S, O and contamination of chemical origin; influence of sigma phase; influence of stress; grain size resulting from different welding methods. Ferrite introduced into austenitic stainless steel decreases chances of cracking. 81 ref. (K9n, 9-72; SS-e)

551-K.* **Magnetic-Force Welding.** Ford R. Park. *Product Engineering,* v. 29, Sept. 15, 1958, p. 82-85.

Adaptation of projection welding techniques, applying forging pressure at time when weld zone is most fluid permits strong weld without damage to vinyl coating. (K3q)

552-K.* (Dutch.) **Manufacture of High-Pressure Containers.** J. H. A. Wennink. *Lastechniek,* v. 24, June 1958, p. 101-103.

Pressure vessels manufactured either from low-alloy, creep proof, heat resistant steel with 1% Cr and 0.5% Mo corresponding to ASTM 301-Gr.B or from "clad steel" (i.e., steel with 0.5% Mo-type ASTM 204-Gr. A), clad with 4 mm. 18-8 stainless steel (Type 347). Both materials are preheated to 200° C. before autogenous cutting and welding. Plates are cut, tested with ultrasonics and formed into semicylindrical bodies either by press or by hot rolling. When welded, the filler metal must have the same composition as the base metal. Weld testing methods. (K9, T26q; SS)

553-K. Arc Spotwelding Stiffens Louver Panels. Richard Molthop. *American Machinist,* v. 102, Sept. 8, 1958, p. 90-91.

Manual arc welder joins angle-iron stiffeners to sheet stock by spot welding through a drilled templet. Eliminates sheet distortion and reduces costs without loss in quality. (K1d; CN-g)

554-K. Fastening Devices. John J. Dwyer, Jr. *American Machinist,* v. 102, Sept. 8, 1958, p. 97-112.

Properties, applications of rivets, screws, bolts, studs, locknuts, inserts, pins, washers, retaining rings, quick release fasteners. (K13)

555-K. High Quality Fusion Welding of Aluminum. Pt. 2. Thomas B. Correy. *Light Metal Age,* v. 16, Aug. 1958, p. 12-14, 16, 22.
(K1, W29a; Al-b)

556-K. Contribution of Brazing in Light Engineering. E. V. Beatson. *Machinery (London),* v. 93, Aug. 27, 1958, p. 473-481.

Brazing of heat resistant alloys, stainless steel; high-frequency and induction brazing; process selection, design and development of methods. (K8; SS)

557K. Pressure Welding. *Metal Industry,* v. 93, Aug. 22, 1958, p. 152-154.
(K5)

558-K. Soldering Aluminum — a Simple Fluxless Technique. G. M. Bouton and P. R. White. *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. G10-G11.

High-strength joints formed by heating pieces with a torch, applying a Zn-base solder stick. Solder flows under oxide film, wetting Al, giving secure bond. (K7c; Al-b)

559-K. Ultrasonic Welding Comes of Age. J. Byron Jones and W. C.

Potthoff. *Tool Engineer,* v. 41, Sept. 1958, p. 90-94.
(K6r)

560-K. Brazing Honeycomb Sandwich. Frank J. Filippi. *Tool Engineer,* v. 41, Sept. 1958, p. 98-101.

Brazing done in inert gas-filled retort, using pneumatic bay for pressure, temperatures up to 2200° F. Uniform heating obtained by using dummy mass to create thermal balance. (K8j; 7-59)

561-K.* (Dutch.) **Welding of Stainless Steel.** B. Mulder. *Lastechniek,* v. 24, June 1958, p. 95-100.

Use of tack welds in preliminary spacing of plates; shrinking phenomenon in tack welds. Magnetic field effect on the arc. Electrodes are of stainless steel. (K1; SS)

562-K. (Dutch.) **Stud Welding in Practice.** J. A. N. Clevers. *Lastechniek,* v. 24, June 1958, p. 103-106.

Stud welding can offer various advantages; time saving, no weakening of the material by drilling holes, lighter construction and no leaks. Has been used for several decades in America in ship-building, construction of buses, boiler-making, anchoring of fire resistant furnace walls, bridge-building and suspension of pipelines. (K1f)

563-K. (Japanese.) **Ultrasonic Welding.** Naoyuki Watanabe. *Metals,* v. 28, July 1958, p. 512-515.

High-tension ultrasonic waves can weld either homogeneous or heterogeneous pairs of metals. Static load range is 2 to 360 kg., frequency is 4 to 40 kc., power is 100 w. to 2 kw., and a pulse lasts 0.5 to 1.5 sec. Method is most suitable for welding metallic foils but is also applicable for thin plates. Metals are welded without being melted. (K6r)

564-K.* **Welding the Refractory Metals.** L. F. Yntema. *Metal Progress,* v. 74, Sept. 1958, p. 105-108.

Tantalum, columbium, molybdenum and tungsten are used on many devices operating at high temperatures because of their high melting points and high-temperature strength. Because of their reactivity with air and their affinity to low-melting metals, they require careful control of welding variables. (K-general; EGA-d, Ta, Cb, Mo, W)

565-K.* **Effect of Surface Treatment on the Adhesive Bonding Properties of Magnesium.** H. W. Eickner. *University of Wisconsin, Forest Products Laboratory, U. S. Dept. of Agriculture,* no. 1865, June 1958, 30 p.

Several types of surface treatments for AZ31-H24 Mg, including deoxidizing, chemical sealing and anodizing methods, were investigated as pretreatments for bonding with commercial metal-bonding adhesives. In addition to original tests of bond quality, tests were also made after the specimens were aged at elevated temperature, high humidity and salt-water spray conditions. 17 ref.
(K12, L-general; Mg-b)

566-K.* **Brazing Alloys for Guided Missiles.** A. T. Cape. *Metal Progress,* v. 74, Sept. 1958, p. 99-104.

Many types of brazing alloys are available and selection of the right one for the job depends on such factors as kind of materials to be joined, service to which it will be subjected and methods of brazing to be used. Modifications of standard brazing materials can be used to give added joint strength and other special properties.
(K8, T24e; SGA-f)

567-K.* **Chlorine Improves Aluminum Weld.** (Digest of "Chlorine Additions for High-Quality MIG Welding of Aluminum Alloys". M. B. Kasen and A. R. Pfluger. Western Welding, Brazing and Heat Treating Conference, Stanford Research Institute, Menlo Park, Calif., Mar. 1958.) *Metal Progress,* v. 74, Sept. 1958, p. 145-146, 148, 150, 152.

Addition of minute quantities of Cl to the arc area during flat-position MIG welding of Al-Mg alloys will effectively counteract hydrogen, propane, water vapor and oxygen when each contaminant is present in the arc area in sufficient quantity to seriously affect quality of the welds. Chlorine additions are also effective in counteracting the deleterious effects of contaminants on the filler wire surface. (K1d; Al-b)

568-K.* **Fabrication of Hollow Steel Propeller Blades.** Frank J. Altmann. *Welding and Metal Fabrication,* v. 26, Aug. 1958, p. 272-276.

Contour rolling, precision forging, flash and fusion welding in the production of hollow propeller blades from AMS 6434 steel.
(K-general, F22, F23, T24; AY)

569-K.* **Gas-Electric Welding With Constrained Moulded Joints.** D. A.

Dudko and F. M. Vinogradskii. *Welding and Metal Fabrication,* v. 26, Aug. 1958, p. 289-290.

Process details and advantages in carbon dioxide-shielded, metal-arc welding with constraining molds for semi-automatic and automatic welding of steel 0.31 to 1.5 in. thick in any position. (K1d; ST)

570-K.* (English.) **Lining a Steel Pressure Vessel With Titanium.** F. F. Ates. *Lastechniek,* v. 24, July 1958, p. 131-136.

Incorporation of fixed Ti lining, 0.8 mm. thick, into a steel pressure vessel, about 80 cm. in diameter and 4 m. long for use in petrochemical industry at working temperature of 140° C. and pressure of 8 atm. Welding equipment, conditions and procedure in spot welding and argon-shielded arc welding of Ti lining. Causes of weld cracking and failure. (K1d, K3n, T26q; ST, Ti)

571-K.* (English.) **Use and Application of Clad Steel. Metallic Liners and Overlay Deposits in the Manufacturing of Vessels for the Chemical Industry.** L. Capel and C. Nederveen. *Lastechniek,* v. 24, July 1958, p. 136-149.

Chemical composition and mechanical properties of backing plates and stainless steel cladding material. Joint design and electrode selection related to problems in welding clad steel. Effects of weld dilution by base material and mild steel electrodes on weld cracking and defects. Heat treatment and application of clad steel; application and welding of metallic liners. Deposit welding and uses for corrosion resistant stainless steel deposits. (K1, T26q; SS, 8-66)

572-K.* (Dutch.) **Welding of Aluminum in General and for Shipbuilding in Particular.** *Lastechniek,* v. 24, Aug. 1958, p. 161-170.

General direction for electric welding. Distance regulator, recommendation of a high-frequency generator to simplify the ignition and stabilization of the arc. Tools and accessories needed. Importance of careful selection and preliminary processing of the plate. Adjustment of the edges of the plates must be absolutely correct and the advance aperture must have the same width throughout; fastening plates together for butt welding; preliminary cleaning with revolving steel brush, dressing with flat chisel, removal of slag pockets, grinding; horizontal welding of butt seams; angle welding. (K1, 1-52; Al)

573-K.* (German.) **Further Development in Cold Pressure Welding.** Wilhelm Hofmann and Hans-Jurgen Schuller. *Zeitschrift für Metallkunde,* v. 49, June 1958, p. 302-311.

Silver and gold specimens were butt welded in high vacuum and results compared to welds in inert atmosphere. To reduce the pressure required for cold welding, various shapes of specimens were tried out; and the deformation process as well as the influence of time was studied. Armco iron was butt welded with Al and Cu. A joint approaching the tensile strength of Al was obtained, while with Cu cold hardening prevented consistent results. 33 ref. (K5, 1-67; Ag, Au, Fe, Al, Cu)

574-K.* (Russian.) **Effect of Arsenic on Weldability of Low-Carbon Steels.** A. G. Kalashnikov. *Stal',* v. 18, Aug. 1958, p. 736-739.

Method of forge welding without fluxes of Ct. 3 steel containing up to 0.25% As with bar thickness up to 20 mm. Weldability of thin bars of killed steel is higher than that of rimming steel. As bars increase above 20 mm. thickness, welding becomes more difficult; and with further increase of As content above 29%, the quality of the welds decrease. 7 ref. (K9s, 2-60; CN-g, *As*)

575-K.* (Russian.) **Structure and Mechanical Properties of Alloy Welds in Titanium.** S. M. Gurevich. *Metallovedenie i Obrabotka Metallov,* Aug. 1958, p. 18-21. (Henry Brutcher, Altadena, Calif., Translation no. 4315.)

Effect of alloy elements on structure of high-strength Ti welds. By alloying the welds to 4-5%, without changing its single-phase structure, the plasticity of the weld is preserved to a large extent. To stabilize the beta phase, the maximum limit of weld alloying should not exceed 2-3%. Alloy metal welds with an original needle-like beta phase microstructure have best plasticity and ductility after welding. 9 ref. (K9, M27, Q-general; Ti)

576-K.* (Russian.) **Localized Heat Treatment of Welds Made by Electroslag Process.** V. N. Novikov, I. E. Tutov and A. I. Kondrashev. *Metallo-*

vedenie i Obrabotka Metallov, Aug. 1958, p. 38-43. (Henry Brutcher, Altadena, Calif., Translation no. 4320.)

Welding of plate steel (100 ton) of type 22K. The large crystal structure of welds produced by electroslag process is rectified by normalizing, thereby increasing plasticity of steel. After normalizing the mechanical properties of the welds and adjacent areas are in every respect similar to those of basic metal plate, regardless of methods used to heat the weld. The most effective heating method for normalizing metal in area of weld is induction heating at industrial frequencies. For plates with 0.22% C, localized electrothermal treatment is most effective. (K6, J24; ST, 4-53)

577-K.* (Russian.) **Automatic Arc Welding of Aluminum Alloy Sheets.** G. D. Nikiforov. *Svarochnoe Proizvodstvo, Aug. 1958*, p. 7-10.

New Al alloy of excellent weldability contains 6.5% Mg, 0.7% Mn and 0.3% Ti. Combination of Mg with Al results in supersaturated alloy which does not decompose during annealing. The combination of Mn with iron, $Al_6(MnFe)$, increases corrosion resistance of alloy. Welding by fuzing electrodes under blanket of flux results in a weld as strong as original metal. (K1, 2-60; Al-b, 4-53)

578-K.* (Russian.) **Study of Tendency of Weld Metal to Form Hot Cracks.** M. Kh. Shorshorov and V. S. Sedykh. *Svarochnoe Proizvodstvo*, Aug. 1958, p. 10-14.

Investigation of low-carbon and austenitic steels, welded with different types of electrodes. Hot cracks formed during crystallization of metal seam as result of tensions arising during cooling of weld. Liquid layers are present during formation of dendrites. At a given interval during crystallization the metal has extremely low plasticity. It is during these temperature intervals that cracks form at points where the intermetallic bonds are weakest. 7 ref. (K1, K9, 9-72; CN-g, SS)

579-K.* (Slovakian.) **Copper-Phosphorus Brazing Alloys.** Pavel Slysko. *Zvaranie*, v. 7, Aug. 1958, p. 245-248.

Copper and low-carbon steel were brazed with the mixture Cu-P8 (=CSN 423370). To braze tombac, a high-phosphor mixture (5.72% Ag, 86.8% Cu, 7.15% P and 56.5% Cu, 2.0% Si, 5.90% P, 35.5% Zn) and a low-phosphor mixture (56.5% Cu, 2.05% Sn, 0.98% Si, 3.96% P, 36.5% Zn) were used. For steels, the above mixtures are not recommended because of the formation of brittle phosphides in the transition zone between the basic metal and the braze alloy. (K8; Cu, CN-g, SGA-f)

580-K.* (Slovakian.) **Repair Welding of Slag Pits in the Surface of Railway Wheels.** Ladislav Muncner. *Zvaranie*, v. 7, Aug. 1958, p. 251-252.

Slag pits in the larger flat surface of 20 x 30 x 300-mm. tires of unalloyed carbon steel with 0.43% and 0.60% C repaired by cutting out pit to clean material, preheating to 320-370° C., filling pit using a 5-mm. diameter electrode E44.33 or E44.83, reheating to 320° C. for ¼ to 1 hr. in air, tempering at 540-560° C. for 5 hr. in air, grinding smooth. Repaired surface tested for defects. (K1, 18-72, T23; ST)

581-K.* **The Relationship Between Weld Cracking and Alloy Constitution in Some Binary and Ternary Magnesium Alloys.** C. L. Kobrin and R. A. Dodd. *American Society for Metals, Transactions*, v. 51, Preprint no. 101, 1958, 7 p.

The susceptibility to weld cracking of alloys corresponding to various Mg-rich binary systems is investigated using a restrained weld test. The variation in results with the different alloy systems can be reasonably well interpreted in terms of the respective solidification ranges, and only the Mg-rich Mg-Zn alloys are sensibly prone to cracking. Cracking versus composition contours are given for the industrially important Mg-Zn-Al and Mg-Zn-rare earth systems. 14 ref. (K9n, M24b, M24c; Mg, 9-72)

582-K.* **Resistance Welding Procedures and Design.** Lester F. Spencer. *Welding Engineer*, v. 43, Oct. 1958, p. 44-47.

Resistance welding equipment and controls. Single-phase a-c. machines are the "work horses". The dry-disk rectifier system, used for spot, projection and seam welding, is also used to convert three-phase power to single-phase d-c. In welding high-conductivity alloys and materials with narrow plastic ranges, the equipment must have low inertia in the electrode holder and a movable head. Both pre- and postheat controls are mandatory in resistance welding hardenable carbon and alloy steels. (K3, 1-52, W29c)

583-K.* Ultrasonics: a "Sound" Welding Technique. *Welding Engineer,* v. 43, Oct. 1958, p. 52, 53.

Degreasing, welding, weld inspection and shop decontamination are some of the uses of ultrasonic sound waves. (K6r)

584-K.* Submerged-Arc Welding of Uranium. Gale S. Hanks, J. M. Taub and E. L. Brundige. *Welding Journal,* v. 37, Sept. 1958, p. 890-896.

Submerged-arc process offers a welding technique where the flux forms a fluid protective blanket above the liquid filler metal. Both fused flux and filler metal cool and solidify under the unfused flux. Properties of weld metal made by submerged-arc welding using the developed flux showed tensile strengths nearly 65% greater and yield strengths approximately 95% greater than those of as-cast metal. (K1e; U)

585-K.* Comparisons Between Welds in Iodide and Sponge-Base Titanium Alloys. W. J. Lewis, M. L. Kohn and G. E. Faulkner. *Welding Journal,* v. 37, Sept. 1958, p. 385s-390s.

Comparisons between the tensile strength, weld-joint bend ductility and weld-metal notch toughness of the iodide and sponge-base alloys, indicated that increased interstitial and substitutional alloy content strengthened the alloys, but weld-joint bend ductility and weld-metal notch toughness were adversely affected. Starting with iodide-base alloys which contain 1.5% beta stabilizers, the tensile and yield strengths were doubled (an increase of 40,000-60,000 psi.) by combining the strengthening effects of the higher interstitial content of the sponge-base alloys, a 1.5% beta-stabilizing addition and a 3% Al addition. (K9r, K9s; Ti-b)

586-K.* Experimental Results of the Slag-Metal Interaction in Manual Arc Welding. Minoru Okada and Harumasa Nakamura. *Osaka University, Technology Reports,* v. 7, Oct. 1957, p. 425-437.

Study of the reaction $(FeO) + [Mn] \rightleftarrows [Fe] + (MnO)$ in manual arc welding of steel. The following reactions are observed: (1) reaction of filler metal and flux passing through air; (2) reaction in the molten pool. (K9n, K1)

587-K.* (Russian.) Welding Cast Austenitic Steel. A. E. Runov, F. I. Pashukanis and K. V. Lyubavskii. *Svarochnoe Proizvodstvo,* Aug. 1958, p. 1-7.

Presence of a certain quantity of the ferrite phase in the original cast austenitic Cr-Ni steel eliminates cracking which has led to development of new alloy—IX20N12T-L—that can withstand prolonged working at 600°. Alloy has ferrite content of 1.5%, and has high plasticity after heat treatment as well as after aging. Variation in cooling rate has no effect on ferrite phase or steel structure. 7 ref. (K9, 2-60; SS, 9-72)

588-K.* (Russian.) Pressure Welding of Heterogeneous Metals Under Vacuum. N. F. Kazakov. *Svarochnoe Proizvodstvo,* Aug. 1958, p. 23-24.

Success in welding metal-ceramics depends on Co content as well as on grain size. The smaller the grain structure the stronger the weld. Pressure and surface cleanness also have big influence. Increase in pressure at low temperatures shows little effect on weld strength, but pressure increase at high temperatures has a marked effect. The rougher the surface, the weaker the welds. Welding in vacuum, and without oxidation, eliminates brittle cracks and other defects. (K5, 1-73; 6-70)

589-K. Boost Powder Metal Part Size. R. H. Weichsel and E. T. Johnson. *Iron Age,* v. 182, Oct. 2, 1958, p. 80-81.

Large, complex powder metal bearings, other shapes possible through new Ag soldering technique which creates thin joints with strength equal to parent metal. (K7f; Ag, 6-72)

590-K. Dip Brazing of Aluminum Pays With Accurate Assemblies. E. G. Slotta. *Iron Age,* v. 182, Sept. 25, 1958, p. 92-93. (K8n; Al-b)

591-K. Magnetic-Flux Gas Shielded Arc Welding. J. E. Dato. *Iron and Steel Engineer,* v. 35, Sept. 1958, p. 160-165.

New process, using flux conveyed to wire electrode by CO_2 shielding gas and magnetically coating the wire, produces rapid, sound welds. (K1d)

592-K. Riveting Is No Small Job. Bartlett West. *Modern Machine Shop,* v. 31, Oct. 1958, p. 117-121.

Semi-automatic riveter is used in scatter-pattern riveting of large fuselage panels for DC-8 jet-propelled airliners.
(K13n, W1h, T24a; 18-74)

593-K. Fabricating Plastic-Clad Sheet Metals. *Welding and Metal Fabrication,* v. 26, Aug. 1958, p. 294-297.

Techniques utilized in drawing, spot welding, projection welding, steel or Al sheet laminated with polyvinyl chloride film.
(K3, G4; Al, ST, 7-59)

594-K. Control of Melting Rate and Metal Transfer in Gas-Shielded Metal-Arc Welding. Pt. 2. Control of Metal Transfer. W. A. Lesnewich. *Welding Journal,* v. 23, Sept. 1958, p. 418s-425s.

Axial-spray transfer is preferred to globular transfer and to rotating-spray transfer to assure maximum arc stability and minimum spatter.
(K1d)

595-K. Cooperative Investigation of a New Welding Electrode for Stainless Steel. R. D. Wylie. *Welding Journal,* v. 23, Sept. 1958, p. 426s-432s.

Evaluation of a new welding procedure for use in high-temperature steam piping. Tensile properties, impact-test results including the effect of aging, corrosion and oxidation resistance, high-temperature creep, relaxation and stress-rupture. 16 ref.
(K1, W29L, Q-general; SS, 4-60)

596-K. (Russian.) **New Materials and Equipment for Gas Welding.** *Svarochnoe Proizvodstvo,* Aug. 1958, p. 37-41.
(K2, 1-52)

597-K. (Russian.) **Vibration Strength of NL2 Steel Butt Welds.** V. N. Savel'ev, D. I. Navrotskii, V. A. Makurin and V. Yu. Shishkin. *Svarochnoe Proizvodstvo,* Aug. 1958, p. 14-18.

Uniform strength of low-alloy steel welds can be obtained by vibrational as well as static stress. Method proposed for eliminating localized weaknesses so as to achieve uniform butt weld strength.
(K1, Q27; ST, 7-51)

598-K. (Pamphlet.) **Kaiser Aluminum Weldor's Training Manual—Inert Gas Process.** 129 p. 1958. Kaiser Aluminum and Chemical Sales, Inc., 919 N. Michigan Ave., Chicago 11, Ill. $1.

First section presents essential factors about both tungsten-inert-gas and metal-inert-gas welding techniques. Second and third sections offer step-by-step exercises.
(K1d, A6k; Al)

599-K.* New Power Source Broadens Use for CO_2 Welding. H. J. Bichsel, E. J. Steinert and E. R. Gamberg. *Iron Age,* v. 182, Oct. 23, 1958, p. 61-63.

Automatic all-position CO_2 welding is now possible by the use of a dynamic reactor, developed by Westinghouse, that limits the rate of weld current. It permits the use of larger wire sizes and, for the first time, use of CO_2 for vertical and overhead welding.
(K1d, W29c)

600-K.* (Slovakian.) **How to Weld Circular Sections by the Vertical Electro-Slag Process.** Julius Zeke. *Zvaranie,* v. 7, July 1958, p. 196-200.

With rectangular sections the space between the parts to be welded is filled, starting from a shelf. To provide secure welding of circular sections two designs are illustrated.
(K6)

601-K. Design for Production by Welding. John Mikulak. *Welding Journal,* v. 37, Sept. 1958, p. 871-881.

Weldments designed for optimum performance and fabrication economy often combine castings, forgings, pressings and extrusions with plates and shapes. (K-general, 17-51)

602-K. Inert Gases for Controlled-Atmosphere Processes. E. F. Gorman. *Welding Journal,* v. 37, Sept. 1958, p. 882-889.

Effective application of argon or helium for controlled-atmosphere processes depends upon utilization of appropriate purging techniques for chambers or furnaces.
(K1d, W29e)

603-K. An Investigation of Lap Seam Welds in 17-7 PH Stainless Steel. E. J. Funk and A. C. Willis. *Welding Journal,* v. 37, Sept. 1958, p. 897-905.

Development and calibration of instrumentation for measurement of welding current. Seam welding of 17-7 PH stainless steel in TH-1050 condition. (K3p; SS)

604-K. (Czech.) **A New Type Ceiling-Mounted Spot Welding Machine.** Ladislav Pliva. *Zvaranie,* v. 7, Aug. 1958, p. 238-244.

Welding machine KP24 (24-kva. transformer efficiency), and tongs. (K3n, 1-52)

605-K.* High Strength Titanium Alloy Has Good Weldability. F. A. Crossley. *Iron Age*, v. 182, Oct. 30, 1958, p. 84-86.

With low alloying additions the best hope of getting high strength lies in age or dispersion hardening. A new Ti-3Mo-0.25Be alloy shows commercial promise. Data were obtained for a 10-lb. ingot made from 100-Bhn. sponge by double arc melting. Graph shows hardness versus solution temperature and aging time. Data on tensile strength, structure, strength of fusion welded samples, creep resistance. (K9s, J27, Q-general; Ti-b)

606-K.* Die-Cut Adhesive Film Bonds Iron to Aluminum. *Iron Age*, v. 182, Oct. 30, 1958, p. 88-89.

High-strength, thermosetting film adhesive, a nitride phenolic. Room-temperature shear strength of the film ranges from 2800 to 3500 psi., and its peel strength is 168 lb. per in. of film width. Other qualities of the film adhesive include good flexibility and resistance to salt spray, high humidity and oil. Assembly of plates. (K12; Fe, Al)

607-K.* Quality Welds Join Missile Engine Frames. George H. DeGroat. *Metalworking Production*, v. 102, Oct. 10, 1958, p. 1787-1788.

All welding is by the gas-shielded arc technique with tungsten electrodes and AWS 502 filler rod. Complete penetration is required in all joints. The arc-shielding gas is argon, which is also applied as a back-up gas on lower joints in the frame. A lighter-than-air mixture of 75% He and 25% A is the back-up for upper frame joints. (K1d, T24b)

608-K.* New Techniques for Welding Aluminum Plate. A. A. Smith. *Welding and Metal Fabrication*, v. 26, Sept. 1958, p. 312-317.

Supplementary argon nozzle enables satisfactory welding at currents hitherto unusable because of the formation of gross oxide films and unstable arc condition known as puckering. (K1d, 1-52; Al)

609-K.* Post-Weld Treatment of Welded Units for the Relief of Stress S. J. Watson. *Welding and Metal Fabrication*, v. 26, Sept. 1958, p. 318-322.

Relief of residual stresses generated by thermal contraction after welding minimizes risk of subsequent distortion or cracking. Level of residual stress after heat treatment depends on such factors as material composition, stress-relieving temperature and time, stress level before treatment. 9 ref. (K9q, J1a)

610-K.* Fabrication Reactors for a Catalytic Reforming Unit. *Welding and Metal Fabrication*, v. 26, Sept. 1958, p. 323-327.

Difficult welding and fabricating problems in the construction of Cr-Mo steel reactors, and pressure vessels for a catalytic reforming unit. Three welding methods were used: manual metal arc, automatic submerged arc and inert-gas-shielded arc. (K1, T26q, W11p; AY, *Cr*, *Mo*)

611-K.* Vacuum Welding of Metals. J. A. Stohr and J. Briola. *Welding and Metal Fabrication*, v. 26, Oct. 1958, p. 366-370.

Ability to concentrate considerable energy on very small surface areas facilitates production of high-quality, accurate welds, which cannot be obtained by any other fusion method. Localization of energy precludes undue over-all heating of the workpiece to avoid distortion and to produce accurate fabrications. Chemical cleanliness makes the process of interest to industries such as atomic energy or the manufacture of electronic valves. (K6, 1-73)

612-K.* Practical Aspects of Automatic Welding. J. A. Lucey. *Welding and Metal Fabrication*, v. 26, Oct. 1958, p. 375-380.

Processes for automatic arc welding of carbon steels compared, namely: submerged-arc, using a continuous coil of bare wire and a granulated welding composition which shrouds the arc; visible arc, employing a continuously coated electrode, generally known as the Fusarc process; Fusarc/CO_2 process, in which a shield of carbon dioxide gas is used in addition to the coated electrode. Study of joint design, edge preparation and fit-up, joint cleanliness and welding in the open welding current, arc voltage, speed and gage of electrode is made. (To be continued.) (K1)

613-K.* (German.) Welding of Nickel and Nickel Alloys. H. Herrmann. *Giesserei Praxis*, no. 17, Sept. 10, 1958, p. 344-346.

Because of high corrosion resistance, Ni and Ni alloys are increasingly used for coatings on iron and steel. Physical properties of pure Ni and different alloys. Characteristics of Monel, K-Monel, Corronel, Inconel. All types are well suited for welding procedures provided preparation of joints and condition of material is adequate. Six types of welding are autogenous, electric arc, carbon arc, inert-gas-shielded, atomic hydrogen and resistance welding. (K-general; Ni)

614-K.* (German.) **Long-Time Stress Tests With Bonded Light Metal Joints.** K. F. Hahn. *Metall*, v. 12, Sept. 1958, p. 811-814.

Light metal strips (Al-Cu-Mg) 20 x 1.5 mm. bonded with "Araldit 123B" and "Redux". Joints affected by high temperatures; even at room temperature elongation and breaking in finite time were observed with a load of 50% breaking strength. 7 ref. (K9, K12; Al-b)

615-K.* (German.) **Internal Stresses in Welds Detected by New Method.** W. Radecker. *Schweissen und Schneiden*, v. 10, Sept. 1958, p. 351-358.

Stresses in rimming converter steel, rimming openhearth steel, mild steel, steel for gas cylinders tested by filling a circular notch on the surface using different electrodes and boiling the weld in a 60% solution of anhydrous calcium ammonium nitrate. By observing corrosion along hairline cracks, stresses can be detected. Effect of stress-relief treatment. 5 ref. (K9r, Q25, 1-54; ST)

616-K.* (German.) **Experiments With the Electroslag Welding Process.** R. Muller. *Schweissen und Schneiden*, v. 10, Sept. 1958, p. 359-367.

Experimental welding of 50-mm. sheet metal with 44 v. and about 500 amp. with one electrode. Slag produced with powder UM 90. Process explored by X-rays. Relationship between feeding speed of electrodes and amperage and feeding speed and specific electric energy. Welds made with different electrodes, base metals, more than one electrode, stationary and swinging electrodes. Examination by metallograph, chemical and physical tests. 6 ref. (K6)

617-K.* (Japanese.) **Cold Welding of Metals Other Than Iron.** T. Saito and K. Yamaji. *Metals*, v. 28, Sept. 1958, p. 702-708.

Temperature change of the surface is observed by a thermocouple during the welding process but no appreciable change is found. Microscopic test, even with electron microscope, cannot detect the welded surface. Atomic diffusion of Al in Cu solid solution near the welded surface is detected by electron diffraction analysis. During the process of cold welding, many dislocations may occur under large stress and, therefore, many atomic vacancies may occur, which make atomic diffusion possible. (K5)

618-K. New Welding Techniques Ready Titanium for CPI. *Industrial and Engineering Chemistry*, v. 50, Sept. 1958, Pt. 1, p. 71A-72A.

Simple fusion, resistance and flash welding techniques. Shielding with argon and helium is required. (K-general; Ti-b)

619-K. Pressure Welding of Metals. D. R. Milner. *Nature*, v. 182, Sept. 6, 1958, p. 638-639.

Report on Conference at University of Birmingham, June 19, 1958. (K5)

620-K.* (French.) **Deep Penetration Arc Welding With Coated Electrodes. Pt. 4. Results. (Installment 2.) Effects of Electrical Characteristics on Depth and Uniformity of Penetration. Study of Soundness and Mechanical Characteristics of Joints.** A. Gaubert. *Soudage et Techniques Connexes*, v. 12, July-Aug. 1958, p. 249-262.

Evaluation of penetration and joint soundness in welds made on a.c. and d.c. and with various types of current-generating equipment. Other factors found to influence soundness were welding speed, arc length and water content of electrode coatings. Mechanical characteristics and crack sensitivity were determined in temperature range from minus 20 to plus 40° C. A killed Martin steel was principal test material; a few tests were made on Thomas steel. (K1a; ST)

621-K.* (French.) **Welded Equipment at the Marcoule Plutonium Extraction Plant.** P. Couturier. *Soudage et Techniques Connexes*, v. 12, July-Aug. 1958, p. 277-289.

Welding procedures used on stainless steel piping, storage and processing tanks in extraction and purification equipment, where corrosion (nitric acid) and absolute tightness are of prime importance. Since operations started only recently, no

data are available on performance of welds; however, mechanical tests and radiographic inspection of welded assemblies indicate that they will be satisfactory. Extraction process is described and diagrammed. (K-general, C-general, T29, 17-57; Pu, SS)

622-K.* High Quality Fusion Welding of Aluminum. Pt. 3. Tungsten Electrodes. Thomas B. Correy. *Light Metal Age,* v. 16, Oct. 1958, p. 8-13.

Discussion of pure W, Th-W and Zr-W electrodes; various factors affecting weld quality; effect of improper gas flow; ventilation. 25 ref. (K1c, W29h; W, Al-b)

623-K.* (German.) **Spot Welding of Heavy-Duty Aluminum Alloys.** E. A. Otte. *Aluminium,* v. 34, Sept. 1958, p. 543-544.

Features of machines used in spot welding heavy-duty materials (Al-Cu-Mg and Al-Zn-Cu-Mg alloys in airplane construction; Al-Mg-Si, $AlMg_3$ alloys in shipbuilding). Electronic control; measuring amperage and time by the Rogowski belt plus an oscillograph; control of pressure exerted by electrodes.
(K3n, 1-52; Al-b)

624-K.* (German.) **Metal Bonding Adhesives and Their Applications.** E. Bader. *Werkstatt und Betrieb,* v. 91, Sept. 1958, p. 565-571.

Adhesives which will harden at ambient temperature and result in joints of high strength. Fields of application, suitable designs and constructions for bonding with adhesives. Adhesive layer with glass fiber, pretreatment of workpieces, processing of adhesives, test results. 26 ref. (K12)

625-K.* (Japanese.) **Metal Surfaces and Adhesives.** H. Hattori. *Metals,* v. 28, Oct. 1958, p. 726-730.

Cohesive force of adhesive is handicapped by the roughness of surfaces, differing thermal expansion coefficients, adsorbed water and oil, Beilby layer and oxide layer as well as the free energy of the surface. (K12, S14)

626-K.* (Japanese.) **Friction Welding.** *Metals,* v. 28, Oct. 1958, p. 772-774.

A turning lathe is used. One part to be welded is fixed and the other part is rotated. Friction causes high temperature and the two parts are plastically deformed; then lathe is stopped and the two parts are kept pressed to each other. (K6)

627-K.* (Russian.) **Effect of Electrode Vibration on Arc Welding Process and Weld Properties.** A. A. Alov and V. S. Vinogradov. *Svarochnoe Proizvodstvo,* Sept. 1958, p. 19-22.

Electrode vibration has important effect on welding process and properties. It stabilizes burning of the arc, lessens overheating of metal, improves weld seams and makes possible welding of thin parts; results in more finely grained and uniform weld; reduces the likelihood of formation of pores, cracks and similar defects. 6 ref. (K1)

628-K.* (Russian.) **Electroslag Welding of Water Turbine Shafts.** A. S. Gellman, S. N. Mel'bard and S. E. Sinadskii. *Svarochnoe Proizvodstvo,* Sept. 1958, p. 26-36.

Extensive research program to develop material and procedures for welding turbine shafts. Possibility of making shafts from rolled sheet steel. Use of Ti as modifier for steel 20 GSL was found unsatisfactory since it leads to embrittlement in zone adjacent to weld. Allowance of 50 mm. thickness with sheet diameter of 1500 mm. was found adequate for shafts; allowance of 16% for compensation for welding deformation and thermal treatment. 5 ref. (K6, W11k; ST)

629-K. Taming Weld Distortion in Extra-Heavy Pieces. George H. DeGroat. *American Machinist,* v. 102, Oct. 20, 1958, p. 146-147.

How a 27-ton welded assembly was made and then machined.
(K1, 3-73, 7-51, 9-74)

630-K. Production Line Steps Up Girder Welding. J. V. Banks. *Iron Age,* v. 182, Oct. 30, 1958, p. 90-92.

Giant squeezing fixture to fit flanges to webs and position assemblies for welding by automatic submerged arc.
(K1e, W29k; T26p, ST)

631-K. (French.) **Chronicle of Steelmaking. Progress in the Welding of Steel.** G. Grenier. *Echo des Mines et de la Metallurgie,* no. 3519, Aug. 1958, p. 489-491.

(K-general; ST)

632-K. (German.) **D. C. Welding Machine for Railroad and Mine Power Supplies.** K. Schydlo. *Schweissen und Schneiden,* v. 10, Sept. 1958, p. 374-376.

Welding machine equipped with a constant-speed governor to compensate unstable voltage. (K1, 1-52)

633-K. (German-French.) **Organization Problems in a Modern Welding Plant.** Othmar Hegi. *Zeitschrift fur Schweisstechnik,* v. 48, Sept. 1958, p. 238-245.

(K-general, A5, 1-52)

634-K. Evaluation of Cast Welding of Cermets to Austenitic Alloys. R. S. DeFries and E. E. Reynolds. Allegheny Ludlum Steel Corp. *U. S. Office of Technical Services,* PB 132831, Aug. 1956, 30 p. (Available at Library of Congress, Washington, D. C.—Microfilm $2.70; Photostats $4.80.)

Cast S-816 has the best combination of strength and ductility essential for a rotor alloy. Sound cast-welded cermets to S-816 alloy test pieces were obtained with 3½-hr. preheat at 1600° F. and pouring temperature of 2900 to 3000° F. This was determined from metallographic examination and tensile tests. (K6, Q-general; SS, 6-70)

635-K. Relationship of Metal Surfaces to Heat Aging Properties of Adhesive Bonds. J. M. Black and R. F. Blomquist. *National Advisory Committee for Aeronautics TN 4287,* Sept. 1958, 30 p.

Thermal-aging properties of five different chemical types of adhesives on stainless steel and Al revealed that a phenol-nitrile rubber adhesive was superior to a phenol-epoxy adhesive on steel, but this order was reversed on Al. Observations indicated probable specific relationships among chemical structure of the adhesive, metal adherend and the resultant thermal stability of bonds after aging at high temperatures. 12 ref. (K12; SS, Al)

636-K. Research Destructive Test Methods for Weldability. William L. Warner. Paper from "Conference on Welding Engineering", *U. S. Office of Technical Services,* PB 131739, 1957, p. 59-90.

Tests for true weldability must show adequate demonstration of the metal's sensitivity to the effects of welding; good reproducibility of the test data from test to test; reasonable simplicity of specimen preparation and method of testing the specimen; good correlation of test results with service performance. 15 ref. (K9s, 1-54)

637-K.* (German.) **Contribution to the Arc Welding of Aluminum Alloys.** *Draht,* v. 9, Aug. 1958, p. 302.

Formation of cracks has been noted in welding thick Al-Mg-Si sheet with Al + 5% Si electrodes. Results from a decrease of Si in the weld metal in the presence of the base metal. Best results obtained when a W electrode of a duralumin alloy, H14 or H15, together with an Al-Zn-Mg-Cu base metal of 2.5 to 12.7 mm. thickness, were used and the joint was heat treated. (K1; Al-b)

638-K.* (German.) **Application of the Iron-Carbon Diagram in Welding Technology.** Friedrich-Carl Althof and Gerhard Hoffman. *Schweisstechnik,* v. 12, Aug. 1958, p. 105-112.

Welding of carbon steel; processes determined by the carbon content; pressure welding up to 1.7% C, fusion welding from 0.25% up. Effect of welding on the structure of material. Studies on stress-relief annealing, spheroidizing, normalizing, homogenizing, hardening and tempering. 10 ref.
(K9, J-general; ST)

639-K.* (Slovakian.) **Repair of Cast Iron Machine Parts by Gas Welding.** Vladimir Mutnansky. *Zvaranie,* v. 7, July 1958, p. 213-218.

The behavior of base and weld metal is tested by grinding a small spot and applying weld metal. Then edges of break are shaped to a V-groove, preserving a root. One of the following methods is used: repair weld without preheating the part; preheating up to 400° C.; preheating up to 650-750° C. according to size and shape of part.
(K2, 18-72; CI)

640-K.* **Welding Stainless Steels and H. T. Alloys. Pt. 1.** *Canadian Metalworking,* v. 21, Oct. 1958, p. 48-50, 52-54, 56-58, 60.

Carbide precipitation, influence of Ta, section thickness, sigma phase, knifeline attack, weld overlays and clad materials. Weldability of corrosion and heat resistant alloys.
(K-general; SS, SGA-g, SGA-h)

641-K* **Want Better Spot Welding? Use Basic Data.** H. Thomasson. *Canadian Metalworking,* v. 21, Oct. 1958, p. 64, 66.

Basic principles of spot welding and the machine regulation of pressure and current. (K3n)

642-K.* **Welding Cast Components for Nuclear-Power Application.** W. H. Rice. *Foundry Trade Journal,* v. 105, Oct. 16, 1958, p. 475-476.

Small castings of simple shape and of greater soundness and quality than extremely complicated castings have led to the increased demand for cast weldments. A typical example is a pump for a land-based nuclear installation. Two cast CF-8 stainless steel halves are welded together. (K1d, W13d; SS, 5)

643-K.* Six Joints to Use When Welding Titanium. *Industry & Welding,* v. 31, Oct. 1958, p. 68-70.

Thickness of weld, electrode type and diameter, root opening, angle of bevel. (K1; Ti)

644-K.* Braze Aluminum to Stainless. *Industry & Welding,* v. 31, Oct. 1958, p. 73, 99.

Combines lightness and good heat conductivity of Al with the strength, heat and corrosion resistance of stainless steel. Brazing method results in gas and liquid-tight bond that is resistant to instant thermal shocks at high temperatures; tensile strength of the bond is greater than the parent Al; high humidity, organic materials or fungi have no effect on the metallic bond. (K8; Al, SS)

645-K.* Selecting Solders for Low-Temperature Service. A. B. Kaufman. *Materials in Design Engineering,* v. 48, Nov. 1958, p. 114-115.

Based on tensile and impact strength, two Pb solders (97.5 Pb, 2.5% Ag and 95 Pb, 5% Sn) are suitable for cold environments. Retention of ductility at low temperatures in Pb-Sn alloys is a function of the Pb content. Sn undergoes an allotropic transformation and becomes brittle under long-time service below −18° F. Increasing Pb content of Pb-Sn alloys progressively lowers the minimum temperature at which these alloys are ductile; above about 70% Pb, the alloys should remain ductile to temperatures near absolute zero. 8 ref. (K7, 2-63, Q23; SGA-f, Pb, Sn)

646-K.* Fabricating Superalloys. H. E. Haley. *Tool Engineer,* v. 41, Nov. 1958, p. 96-101.

Corrosion resistant materials (Ni-Cr-Fe-Mo alloys) require special manufacturing techniques. Welding, forming, forging, heat treating and descaling. (K1, K2; Mo-b, SGA-g)

647-K. Factors in the Selection of Welding Processes. John J. Chyle. Paper from "Conference on Welding Engineering", *U. S. Office of Technical Services,* PB 131739, 1957, p. 9-38.

Principal welding groups are arc, resistance, gas, forge, thermit, induction, welding, flow welding and brazing. Physical and mechanical properties of welds and joint design are correlated with each type. (K-general)

648-K. Engineering Aspects of Welding and Arc Cutting the Aluminum Alloys. P. B. Dickerson. Paper from "Conference on Welding Engineering", *U. S. Office of Technical Services,* PB 131739, 1957, p. 165-178.

Useful data on welds in some of the Al alloys commonly considered for arc welded construction. Strength and ductility of welds. 10 ref. (K-general, G22g; Al-b)

649-K.* Effect of Arsenic on Mechanical Properties of Welds in Mild Steel. D. Canonico and H. Schwartzbart. *Welding Engineer,* v. 43, Nov. 1958, p. 32-35.

Arsenic in steel increased transition temperature but had no significant effect on strength. (K9r; ST, *As*)

650-K.* (German.) **Sandwich Plates in Aircraft Manufacture and Other Industries. Pt. 3.** B. R. Noton. *Aluminium,* v. 34, Oct. 1958, p. 591-595.

Strength tests with the adhesive film Redux 775 used to bond side plates to the Dufaylite core (32 mm. thick) and with the adhesive Catalin 869/6B used in the manufacture of cores. The latter was allowed to set 30 min. at 150° C. and under pressures of 0.7 to 35 kg. per sq. cm. Mechanical properties and moduli of Dufaylite-cores. (K12, T24; 7-59)

651-K.* (German.) **Metal Bonding With New Adhesives.** H. Winter and H. Meckelburg. *Aluminium,* v. 34, Oct. 1958, p. 596-608.

Composition of thermosetting and thermoplastic adhesives; average joint strength. 155 ref. (K12; Al, Cu, Mg)

652-K.* (German.) **Spatter During Arc Welding.** Friedrich Erdmann-Jesnitzer and Gottfried Pysz. *Schweissen und Schneiden,* v. 10, Aug. 1958, p. 303-311.

Spatter as a rule originates in weld metal pool shortly after passage of material from electrode (0.01-0.001 sec.). Phenomenon compared to "cooking" of steel. Attempt is made to relate spattering with gas absorption on electrode side since it is more pronounced in bare-wire electrodes. 17 ref. (K1)

653-K. Wide-Gap Brazing Alloy Assembles Engine Rings. R. C. Kellner. *American Machinist,* v. 102, Nov. 3, 1958, p. 98-99.

Join high-temperature Ni-base alloys with high Ti and Al content. Hold blades to rings in nozzle diaphragms for gas-turbine engines. (K8, W11m; *Ti, Al,* Ni, 17-57)

654-K. Slope Control Makes Better Welds. John Kelly. *American Machinist,* v. 102, Nov. 3, 1958, p. 105-107.

Conditioning the work both before and after welding current is applied. During the up-slope period, the surface is prepared by increasing the heat gradually. During down-slope, the weld is annealed. (K3, K9p, K9q)

7-L. Antigalling Coatings and Lubricants for Titanium. E. L. White, P. D. Miller and R. S. Peoples. Battelle Memorial Institute, Titanium Metallurgical Laboratory, Report 34. *U. S. Office of Technical Services,* PB 121610, Feb. 1956, 54 p. (CMA)

A survey of methods of reducing the galling type of wear indicates that the bare metal cannot be satisfactorily lubricated. Satisfactory wear performance can be obtained by use of coatings of various kinds plus suitable lubricants. Coatings investigated were oxide, nitride and case hardening; metallic, including Cr, Al, Cu and Ni; and chemical conversion, including phosphate, fluoride-phosphate and anodized coatings. The most successful lubricants tested were of the fluorocarbon type. (L general, Q9; Ti, NM-h)

In diesel locomotives. (L17; *Cr*)

18-L. (German.) **Galvanizing of Aluminium.** H. W. Dettner. *Aluminium,* v. 32, Oct. 1957, p. 665-668.

Oxide films which cause difficulty in galvanizing are dissolved and replaced by a film of Cu, Zn, Ni or Fe, deposited by ion exchange, as a basis for adhesion of other metal coatings. 25 ref. (L16; Al, *Zn*)

19-L. (German.) **New High-Speed Method for Hot Tin Plating of Thin Copper Wires.** O. Haugwitz. *Draht,* v. 8, Aug. 1957, p. 336-339.

New machine has speeds up to 5500 ft. per min. high speed, which leads to cost-reduction, is dependent on cleanness of wire surface, pickling agent, wire diameter, bath temperature. (L17, 1-52; Cu, *Sn,* 4-61)

20-L. (German.) **Exhaust and Sealing Hoods Over Chemical Baths for Surface Treatment of Metals.** G. W. Mazurzak. *Draht,* v. 8, Aug. 1957, p. 344-349.

Wire pickling installations can be improved through reduction of the surface contact between bath and outside air. 6 ref. (L12g; 1-52; ST, 4-61)

21-L. (German.) **Centrifugal Polishing.** E. Knuth-Winterfeldt and Ulf Langer. *Metalloberfläche,* v. 11, Aug. 1957, p. 253-254.

Steel specimens to be polished were subjected to a chemical treatment in a mixture of oxalic acid and hydrogen peroxide and then were centrifuged. Advantages are faster polishing, lower temperatures and less pitting. (L10b; ST)

22-L. (German.) **Interruption of Zinc Plating.** H. Bablik, F. Gotzl and E. Nell. *Metall,* v. 11, Aug. 1957, p. 649-651.

Frequently shadows appear on the surface after zinc plating. In these zones zinc-iron alloys rather than pure zinc constitute the surface layer. The reaction speed between iron and zinc is higher than normal resulting in the absorption of the pure

zinc layer during and after plating. Unfavorable rolling conditions can also be blamed. Possible remedies are pickling of the unplated iron sheets and addition of aluminum to the zinc bath. 3 ref. (L17; *Zn*)

23-L. (German.) Effects of Ball Polishing in Surface Treatment. M. Dreher. *Metall,* v. 11, Sept. 1957, p. 752-754.

Materials, form of pieces, surface roughness and surface treatment before polishing; length of polishing operation; obtainable surface finish; economics of the process. 4 ref. (L10d)

24-L. (German.) On the Nature, Composition and Electrical Properties of Oxide Coatings on Electrolytic Condensers. L. Holik and H. Nowotny. *Metall,* v. 11, Sept. 1957, p. 737-740.

Differences in the nature of oxide coatings on Al foils after electrochemical oxidation in relation to initial conditions and the process of formation. Properties of crystallized gamma and amorphous oxides. 6 ref. (L14a, P15; Al, 4-56)

25-L. (German.) Chemical Surface Protection of Light Metal. A. Pollack. *Metall,* v. 11, Sept. 1957, p. 754-756.

Chemical surface protection is preferred to electrochemical processes; it is simpler and more economical and affords good protection against corrosion when used as a base for lacquer coatings. 17 ref. (L14; Al, Mg)

26-L. (German.) Electrolytic Polishing of Metals. H. Mohlberger. *Metall,* v. 11, Sept. 1957, p. 756-761.

Influence of the flow velocity of the electrolyte upon the form of the ampere-voltage curves and their interpretation; electrolytic polishing of copper and brass in phosphoric acid; theories on the mechanism of metal brightness. 29 ref. (L13p)

27-L. (German.) Present State of Electroplating. Willibald Machu. *Stahl und Eisen,* v. 77, Oct. 3, 1957.

Surface preparation, pickling, grinding, polishing, rectifiers, baths. 77 ref. (L17, L general)

28-L. (German.) Spent Pickling Solutions. Kurt Mathesius. *Stahl und Eisen,* v. 77, Oct. 3, 1957, p. 1349-1355.

Methods of recovering suphuric acid, conversion to iron sulphatemono and heptahydrate; mechanical descaling; consumption of sulphuric acid in the iron industry. 14 ref. (L12g, A8b)

29-L. (German.) Acid Copper Plating and the "Cupatier" Process. W. Strauss and E. Roth. *Metalloberfläche,* v. 11, Sept. 1957, p. 281-285.

Very bright copper finishes can be obtained by lowering the working temperature, increasing the suphuric acid content in the electrolyte, increasing the current density, selection of suitable inhibitors. Surface hardness, ductility and corrosion resistance were improved, permitting direct copper plating of iron. Working procedures. 8 ref. (L17, Fe, *Cu*)

30-L. (German.) Problem of Current Distribution in Concentrated Electrolytes. P. Csokan. *Metalloberfläche,* v. 11, Sept. 1957, p. 285-288.

A new method for observing current distribution. (To be continued.) (L17)

31-L. (German.) The "Kolene" Process—a Salt Bath Process for Cleaning Metal Surfaces. K. Falkenmayer. *Metalloberfläche,* v. 11, Sept. 1957, p. 297-304.

Descaling of hot and cold formed pieces, removal of sand and graphite residues from castings, stripping of paint. 21 ref. (L12n)

32-L. (Russian.) Effect of Galvanizing in Cyanide Electrolyte on Mechanical Properties of Steels. I. I. Moroz and N. I. Kudryatsev. *Metallovedenie i Obrabotka Metallov,* no. 8, Aug. 1957, p. 28-33.

Tough steels are subjected to a greater degree of change than softer ones. This may be explained by the tougher steel's absorbing more hydrogen from the electrolyte. (L16, Q general; ST, *Zn*)

33-L. (Russian.) Galvanizing With Zinc Phosphate Electrolyte. A. V. Rikova and E. I. Rudoi. *Metallovedenie i Obrabotka Metallov,* no. 8, Aug. 1957, p. 33-37.

The zinc coating obtained has strong anti-corrosion properties and may be used as an undercoating for Cr plating. (L16, *Zn*)

34-L. (Russian.) Surface Boronization of Low-Alloy Steels. V. D. Taran and L. P. Skurova. *Metallovedenie i Obrabotka Metallov,* no. 6, June 1957, p. 45-47.

Quality of the boronized layer depends on the temperature of the electrolyte and duration of the treatment. 6 ref. (L17; AY, *B*)

35-L. (Russian.) **Tin Economy in Production of White Tinplate.** M. S. Arkhipova, V. D. Mishin and N. S. Smirnov. *Metallurg,* v. 2, July 1957, p. 30-34.

Three original methods of tin recovery in tinplating.
(L17, A11d; Sn)

Different types of shot-blasting; blasting media, cost, defects; wear problems; economic and qualitative results on steel bars and semifinished special steels. (L10c; ST, 4-55)

63-L. (French.) **Influence of the pH of Metallic Surfaces on Paint Adherence.** Claude Hess. *Peintures, Pigments, Vernis,* v. 33, Sept. 1957, p. 798-800.

Types of soil and foreign matter found on untreated surfaces; methods of removal; importance of final rinsing; characteristics of final rinsing bath. (L26)

64-L. (French.) **Electrolytic Oxidation and Galvanic Deposition on Titanium.** H. Richaud. *Revue de Métallurgie,* v. 54, no. 10, 1957, p. 787-792. (CMA)

Effect of various factors (potential, temperature, duration, nature of the electrolyte) on anodic and cathodic treatment of Ti. Formation of oxide layers is a function of time and current density. A natural oxide film on Ti necessitates a preliminary treatment of the surface before electrolytic deposition. (L19; Ti)

65-L.* (French.) **Special Application of Oxy-Acetylene Flame Descaling to the Preparation of Commercial Rolling Mill Products for Spot Welding.** M. Evrard. *Soudage et Technique Connexes,* v. 11, Sept-Oct. 1957, p. 297-317.

Flame heating followed immediately by water-spray cooling eliminates scale and provides necessary surface condition for welding. Influence of flame descaling on mechanical properties and structure of the metal and of spot welds made on steel plate thus treated. 16 ref. (L10g; ST, 4-53)

66-L. (Japanese.) **Anodic Oxidation of Titanium. Pt. 1.** Hisaya Nagasaki and Haruo Ishida. *Light Metals (Tokyo),* no. 25, July 1957, p. 79-85. (CMA)

TiO_2 formed by anodic oxidation is not yet useful as an electrolytic capacitor because it is unstable and current leakage is large. Although aqueous solutions of various salts were used in the anodic oxidation, no stable oxide was formed. A salt bath of 45% $NaNO_3$ and 55% KNO_3 at 250-350° C. and a constant current method gave a film with a low leakage current, a crystallized film with large grains, and significant charge and discharge characteristics. The relationship between capacity, resistivity and voltage of formation was not perfectly linear, and a discontinuity occurred at 35-40 volts. 6 ref. (L19; Ti)

67-L.* (Rumanian.) **Mechanism of Porous Chromium Plating. Pt. A. Study of Porosity.** I. Firoiu. *Revista de Chimie,* v. 8, July 1957, p. 471-479.

Porosity of coatings deposited on steel and copper specimens was studied in terms of density of cathodic current, cathodic processing temperature, concentration of chromic acid, CrO_3/SO_3 ratio, trivalent Cr concentrations, density of anodic current, duration and temperature of anodic processing. Deposits were examined by microscope. 19 ref. (L17, P10m; ST, Cu, *Cr*)

Internal stresses in steel and copper specimens as influenced by density of cathodic current, bath temperature, concentration of chromic acid. 12 ref. (L17, Q25; *Cr*)

69-L.* **Influence of Chloride Ions on the Solution of a Nickel Anode.** A. V. Pomosov and L. I. Gurevich. *Journal of Applied Chemistry of the USSR.* v. 29, Sept. 1956, p. 1475-1479. (Translated by Consultants Bureau, Inc.)

Three characteristic regions of the action of chloride ions on passivation of Ni anodes have been found. In the current density region up to 4.2 A. per sq. dm. with 0.5 g-equiv. per liter of sodium chloride in the bath, Ni anodes dissolve without hindrance; addition of 0.02-0.1 g-equiv. of chlorides per liter favors anode passivation and induces transitory (periodic) passivity. The passivating action of chloride ions is explained by the formation of hypochlorous acid in secondary reactions. 5 ref. (L17a; *Ni*)

87-L.* **Effect of Firing Schedules on Stress-Temperature Relations in Enamel-Metal Systems.** J. H. Lauchner, R. L. Cook and A. I. Andrews. *American Ceramic Society, Journal,* v. 40, Dec. 1, 1957, p. 410-415.

Effect of box and continuous enameling furnace firing schedules on the thermal deflection of enameled iron strips was studied. Effective coefficient of thermal ex-

pansion values were calculated from coefficient of thermal deflection data. Results indicate that the effective thermal expansion values for annealed and unannealed enameled iron agree with the expansion data obtained by an interferometer study of the same enamels. Variation in the cooling rate of the enameling furnaces is sufficient to produce marked change in the development of thermal stress in the enameled iron. Residual compressive stresses in the enamel are increased by rapid cooling from firing temperatures. Tensile stress developed in the enamel during reheating is reduced by previous annealing. 97-L. Some Aspects of Zinc, Copper, Nickel and Chromium Plating. L. Ades. *Metal Finishing Journal,* v. 3, Dec. 1957, p. 477-484, 496.

Deals with composition and operation. (L17; Zn, Cr, Cu, Ni)

98-L.* Direct Chloride Process for Tinning Cast Iron. C. J. Thwaites and J. J. Day. *Metallurgia,* v. 56, Dec. 1957, p. 263-270.

Newly developed process gives adequate adhesion to white metal bearing alloys, provided that fine grit is used for shot blasting and an ebullient flux layer covers the first tinning bath. Influence of the composition and structure of the cast iron, preliminary surface treatment and tinning and whitemetalling conditions. 7 ref. (L16; CI, *Sn,* SGA-c)

99-L.* Deposition of Metals Other Than Those of the Titanium Group by the Hot Filament Technique. R. A. J. Shelton. *Metallurgia,* v. 56, Dec. 1957, p. 283-289.

Deposition of V, Cb, Cr, W, Mo, Re, Fe, Os, Pt, Cu, Be and U. 27 ref. (L25)

100-L. Vacuum Coating at V.M.C. Ltd. *Product Finishing (London),* v. 10, Nov. 1957, p. 98-101.

(L23, 1-73; Al)

101-L. Cadmium Plating: How to Avoid Embrittlement. *Steel,* v. 141, Nov. 11, 1957, p. 132-134.

(L17a, Q26s; ST, *Cd*)

102-L.* Mechanized Surfacing With Alloy Materials. R. S. Zuchowski and J. H. Neely. *Welding Journal,* v. 37, Jan. 1958, p. 22-29.

Inert-gas tungsten-electrode hard surfacing with the addition of tungsten carbide powder; inert-gas consumable-electrode process with cold wire addition; and submerged-arc surfacing with any one of several techniques and with or without powder-alloy addition. (L24)

103-L. Metallurgical Surface Treatment of Tinplate Produced in Liskovec, Czechoslovakia. J. Teindl and A. Hrbek. *Hutnické Listy,* v. 12, no. 4, 1957, p. 329-332. (Henry Brutcher Translation no. 4042, Altadena, Calif.)

Previously abstracted from original. See item 300-L, 1957. (L14a, Sn, 8-62)

104-L. (Norwegian.) Anodic Treatment. Norwegian Aluminum Co. *Teknisk Ukeblad,* v. 104, Oct. 17, 1957, p. 4 of attachment.

Application of color to Al surfaces by anodic treatment. (L19; Al)

105-L. (Russian.) Mechanization of Sandblast Lines. P. N. Aksenov. *Liteinoe Proizvodstvo,* no. 11, Nov. 1957, p. 15-18.

Brief review of 13 works recently published in the USSR and abroad dealing with theoretical and engineering aspects of sandblast machinery. (L10c, W2r)

106-L.* Aluminum Sheathing of Flat Uranium by Extrusion Cladding. A. J. Mooradian. *Atomic Energy of Canada Ltd.,* CRL-46. 27 p. 1957.

The Al sheathing of long flat U metal fuel elements by extrusion cladding has been developed to the point of trial production. The process consist of using the U flat as a moving mandrel over which the sheath is extruded directly, thereby completely encasing the U with Al as it passes through the die. Bonding of the sheath to the core may be achieved in the course of extrusion. The bond is stronger and more uniform in the case of a U plate which has been Ni-plated than in the case of bare uranium. However, in both cases, the sheath is found to be in good sonic contact with the core. Both Ni-plated and bare U flat elements sheathed in Al by the extrusion cladding method have been successfully tested under irradiation. There was no evidence of poor thermal transmission through the U-Al interface under the test condition of 47 watts per sq. cm. This method was developed for cladding flat plates used in making up reactor fuel rods. (L22, F24; U, Al)

107-L. Precision Barrel Finishing. Pt. 6. William E. Brandt. *Automatic Machining,* v. 19, Nov. 1957, p. 59-64.

Application of barrel finishing and tumbling to screw machine products; equipment, media and barreling procedure for descaling, deburring and finishing a variety of screw-machine parts. (L10d, 1-52)

108-L. Weld Hard Facing Materials. W. A. Martin. *Canadian Metalworking,* v. 20, Nov. 1957, p. 58-64.

Welding with hard-facing materials has become the recognized method of dealing economically with problems of metallic wear. (L24; CI, ST)

109-L. Variables Affecting Validity of Accelerated Coating Tests. *Corrosion,* v. 14, Jan. 1958, p. 124-130.

The principal cause of discrepancy is failure to take into account all variables in factors which affect coating performance. Factors are the environment, type of surface and its preparation, care and uniformity of application. (L general, 1-54)

110-L. Masking Film Put on by Dipping. William L. Timm. *Industrial Finishing,* v. 33, Oct. 1957, p. 62-68.

Conveyorized dip coating setup used to apply temporary over-all coating of masking material to metal parts which are to be chemically milled. (L26p, G24b)

111-L. U. S. Develops Ceramic-Type Coatings for Aluminum. John B. Franklin. *Industrial Finishing, (London),* v. 9, Oct. 1957, p. 862-863.

Process involves immersion of clean Al parts in chilled electrolyte and use of 15 to 20 v. at 12 to 15 amp. per sq. ft. between parts and metal tank. Oxide coatings formed are heavier than those obtained by conventional anodizing. (L19; Al)

112-L. Ceramic Coatings Raise Heat Resistance of Super-Alloys. P. A. Huppert. *Iron Age,* v. 180, Nov. 14, 1957, p. 157-159.

Ceramic coatings for protection of superalloys at elevated temperatures, physical properties of ceramic lithium compound and boron nitride. (L27; SGA-h, Li, B)

113-L. New Process Makes Nylon Coatings Possible. *Iron Age,* v. 180, Nov. 14, 1957, p. 160-161.

Process for applying nylon coatings to metal. (L26p)

114-L. Finer Finishes Mean Added Operations. *Metal Removing,* v. 2, Nov. 1957, p. 18-19.

Burnishing methods. (L10b)

115-L.* How to Barrel Finish Eggs. William Biebel. *Plating,* v. 45, Jan. 1958, p. 31-34.

Control of the six variables involved in size of media, speed of the barrel, mass height, water level, ratio of work to media and selec-

tion and use of compound, permit the barrel finishing of eggs and equally delicate parts. (L10d)

116-L.* Liquid Vs. Bar Buffing Compound. E. T. Candee. *Plating,* v. 45, Jan. 1958, p. 35-38.

Advantages of liquids over bars include: Liquids lend themselves to automatic and machine buffing because of infrequent operational interruption to replenish the supply of compound; danger in handling and replacing of bars of the machine in operation is eliminated; liquids lend themselves to many formulations which are not possible to produce in bar form. (L10a)

117-L.* Abrasive Wet Blasting for Cleaning and Finishing Metals. Alan R. Burman. *Plating,* v. 45, Jan. 1958, p. 45-48.

Process is performed with the utilization of a compressed air blasting gun to "throw" a mixture of water and abrasive. Water as the carrying medium allows the use of an extremely wide choice of abrasives; quartz, silica flour, novacite, aluminum oxide, silicon carbide, etc., ranging in particle size from 75 to 5000 mesh. (L10c)

118-L. Let's Cut Finishing Costs. Leland H. Vorce. *Plating,* v. 45, Jan. 1958, p. 50-51.

Current practice in large plating plants involves the most modern backstand equipment, newly improved contact wheels and recently developed resin-bonded abrasive belts as well as newer lubricants. (L10, W2n, W2p)

119-L. Hot-Dipped Aluminum Coatings. Herbert L. Kee. *Product Engineering,* v. 28, Oct. 28, 1957, p. 57-59.

Notes on base materials, both ferrous and nonferrous, to which hot dipped Al coatings can be applied. Corrosive conditions they resist and specific application of coated parts. (L16; Al)

120-L.* Barrel Silver Plating. I. J. Warwick. *Product Finishing,* v. 10, Oct. 1957, p. 61-65.

Chief application of silver plating by barreling. Main types of plating barrels, including semi-immersed, totally immersed and oblique models; electrical current requirement, recommended pretreatment and solutions for barrel plating. (L17, W3b; Ag)

121-L. Phosphating Processes and Their Applications in Metal Finishing. Pt. 5. Process Control. D. J. Fishlock. *Product Finishing,* v. 10, Oct. 1957, p. 84-93, 120.

Method of controlling phosphating processes including solution control and coating control. 18 ref. (L14b)

123-L. Flame Spray Fights Wear and Corrosion. Hoyt Todd. *Welding Engineer,* v. 42, Nov. 1957, p. 37-38.

Results obtained with flame spraying powdered nickel alloys through oxy-acetylene flame and fusing sprayed coatings. (L23; Ni)

124-L.* (Italian.) **Painting of Aluminum and Its Alloys.** *Alluminio,* v. 26, Nov. 1957, p. 489-500.

Techniques and materials; inspection methods. 9 ref. (L26; Al)

125-L. (Russian.) **Protective and Decorative Chromium-Plating of Aluminum Ware.** V. I. Lainer and Yu. A. Velichko. *Vestnik Machinostroeniya,* v. 37, Sept. 1957, p. 48-54. 6 ref. (L17; *Cr,* Al)

126-L.* Anomalies in the Growth of Anodic Oxide Films on Rough Surfaces. L. Young. *Acta Metallurgica,* v. 5, Dec. 1957, p. 711-716.

During the growth of anodic oxide films, surface irregularities of the scale of the thickness of the oxide film are believed to be flattened. The original inner layers of the oxide (new layers are formed on the outside, since metal ions move) are, therefore, constrained to cover a progressively smaller area. The resultant compressive stresses will produce failure if the original metal surface is rough enough. It has been confirmed that with such surfaces progressively less charge is required to form oxide to a given potential at a fixed current density. 21 ref. (L19)

127-L. Barrel Finishing Cuts Costs. *Automatic Machining,* v. 19, Dec. 1957, p. 50-52. (L10d)

128-L. Chemical Surface Preparation of Structural Steel After Erection. Christopher D. Coppard, John H. Lawrence, F. S. Bricknell and Henry W. Adams. *Corrosion,* v. 13, Nov. 1957, p. 141-142. (L14b; ST)

Half-second butyrate has many advantages as clear colorless coating for Al. (L26p; Al)

186-L.* Antimony Plating on Steel and Zinc. G. R. Schaer, W. H. Safranek and C. L. Faust. *Plating,* v. 45, Feb. 1958, p. 139-143.

Antimony may be plated adherently and continuously on steel, if the steel is first conditioned by anodic treatment in acid solutions, or is electroplated with iron. Anodic acid activation of steel prior to plating improved the corrosion resistance of Sb-plated steel, but did not improve the corrosion resistance of Zn-plated steel. Sb-plated steel resisted corrosion better than Zn-plated steel in salt spray fog and in air saturated with water vapor. 14 ref. (L17, R3p; ST, *Zn, Sb*)

214-L. Extrusion Cladding of NRU Fuel Elements. H. S. Milne. *Atomic Energy of Canada,* CRE-701, Apr. 1957, 35 p.

Vertical hydraulic press forces preheated Al billets into a converging chamber of a die-block arrangement. Metal flows around the core material and welds into a continuous sheath over the core as the core is guided horizontally through the die. (L22; Al, U)

215-L. Study of the Oxidation of Steel Plate as Related to Wettability and Adherence of Porcelain Enamel. Henry P. Still, Jr. *Ceramic Society Bulletin,* v. 37, Jan. 1958, p. 22-26.

Quick test to predict enamel behavior on steel plate without performing actual enameling operation. Adherence was correlated with oxidation. No relationship found between wettability and oxidation or adherence. 7 ref.
(L27, Q10c; 4-53, ST)

216-L. New Chemical Process Plates Resistant Nickel. *Chemical Engineering,* v. 65, Jan. 13, 1958, p. 172-174.

Niphos process chemically plates uniform Ni coat on complicated parts impossible to electroplate. Coat is hard, ductile and nonporous. (L28; *Ni*)

217-L. Nickel Protection for Ferrous Metals. *Design Engineering,* v. 4, Feb. 1958, p. 72.

The coating is heated in a reducing atmosphere to provide a tightly adhering Ni-alloy cladding that will not peel or flake. (L22; ST, *Ni*)

218-L. Effectiveness of Various Protective Coverings on Magnesium Fins at Mach Number 2.0 and Stagnation Temperatures up to 3600° R. William M. Bland, Jr. *National Advisory Committee for Aeronautics, Research Memo,* Jan. 9, 1958, 48 p.

(L22, 2-62; Mg, *Ni*)

219-L. Protection of Metals With Tannins. E. Knowles and T. White. *Oil and Colour Chemists' Association, Journal,* v. 41, Jan. 1958, p. 10-23.

Tannin extracts found of value in protecting ferrous metals from atmospheric and underground corrosion; use as wash-primers before painting. Solutions of tannin extracts lay down insoluble weather-resistant ferric tannate on ferrous metal surface. 11 ref.
(L26n, 4-60; ST, CI, NM-g35)

220-L.* (French.) **Special Application of Oxy-Acetylene Flame Descaling to the Preparation of Standard Rolled Products for Subsequent Spot Welding.** M. Evrard. *Revue de la Soudure,* v. 13, no. 4, 1957, p. 195-210.

Best operating conditions in terms of flame power, feeds and force of water jet, with an eye at all times to shop costs and quality of assemblies ultimately executed, were determined by measurement of contact resistances in descaled products. Special series of tests in which

descaling was done by other methods (sand blasting, shot blasting, grinding, chemical descaling) showed that best results in cleaning and subsequent spot welding are obtained by flame descaling. (L10g, K3)

221-L. Internal Burnishing. Lewis Bussey and Walter Vote. *Automatic Machining,* v. 19, Feb. 1958, p. 53-54.

Proper burnishing on multiple spindle automatic screw machine requires smooth reamed hole and secure spindle, slide and tool. Method may replace grinding operation. (L10b, W25, 1-52; ST)

222-L.* Leveling in Cyanide Copper Solutions — a Further Study. Barnet T. Ostrow and Fred Nobel. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 24-28.

With addition agents, modified cyanide copper bath levels and plates regardless of degree of roughness of base metal. The amount and kind of leveling and plating obtained compare favorably with that secured from present-day leveling Ni solutions plus ability to plate Zn die castings directly. 6 ref. (L17; ST, Cu, Zn, *Ni*)

223-L.* Bright and Semi-Bright Crack-Free Chromium. E. J. Seyb, A. A. Johnson and A. C. Tulumello. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 29-35.

Properties of the bright crack-free Cr deposit in comparison with the usual Cr deposits. Corrosion results with the regular salt spray, acetic acid salt spray, Corrodkote and outdoor exposure. 13 ref. (L17a, 8-72; *Cr*)

224-L.* Electroplating on Nickel and Nickel Alloys. W. W. Sellers and C. B. Sanborn. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 36-41.

Four basic steps are an electroplating bath, mechanical preparation, degreasing and cleaning, and activation of the basis metal. Various Ni plating baths which may be used—the Watts-low pH, Watts-high pH, chloride-sulphate, chloride, hard Ni, basic sulphamate, sulphamate plus Cl (-), and the fluoborate baths. Nominal composition, operating conditions, physical characteristics and mechanical properties of the Ni deposits. (L17; Ni)

225-L.* Influence of the Physical Metallurgy and Mechanical Processing of the Basis Metal on Electroplating. Pt. 4. The Effect of Different Ferrous Metals on the Performance of a Watts Nickel Deposit. AES Research Project No. 14. M. H. Jones, Chih-Yeu Lu and J. Zajdowski. *44th Annual Technical Proceedings—American Electroplaters' Society,* 1957, p. 53-69.

Test results on durability of Watts Ni deposit on various ferrous metals shows that there are significant differences between performance of certain metals with deposits of 0.0005 and 0.0001 in. These differences are considerably less at higher plate thicknesses. There is a basic corrosion rate which is determined by deposit thickness rather than the composition of basis metal. (L17c, 3-69; *Ni,* Fe, ST)

226-L.* Get Parts Cleaner by Ultrasonics. Norman G. Branson. *Materials in Design Engineering,* v. 47, Feb. 1958, p. 118-121.

Basically the technique consists of an ultrasonic generator, a transducer, a cleaning fluid and a tank. Widely varying frequencies, different types of transducers and various cleaning fluids. (L10f)

227-L. Textured Steel Metallized in Color. *Metalworking,* v. 14, Feb. 1958, p. 8-9.

Combination vacuum metallizing and enameling process creates a brilliant corrosion resistant finish in any color. Inexpensive finish will replace electroplating in many fields. (L23, L27, 1-73; ST, Al)

228-L. Rolling Improves the Finish, Hardens the Surface. *Metalworking,* v. 14, Feb. 1958, p. 10-11.

264-L.* Descaling of Titanium. W. B. Stephenson, Jr. *Metal Progress,* v. 73, Mar. 1958, p. 87-89.

A hot solution of sulphuric acid and calcium fluoride, followed by nitric-hydrofluoric acid, gives a bright surface, free from pits. Such treatment does not endanger formability. (L12g, Q23q, Q5; Ti)

265-L.* Which Coating at High Temperature? Gordon D. Oxx, Jr. *Product Engineering,* v. 29, Jan. 20, 1958, p. 61-63.

For use above 1000° F., protective coatings should control oxidation of the base metal, prevent erosion and be compatible with the base metal. Good resistance to oxidation is found in the noble metals and the ceramics, which are brittle under high stress or impact loading. Protective scale formation is promoted by about 20% Cr in the stainless steels, cobalt-base superalloys and nichrome, or Al or Cr-Al. Chart of typical coating compositions; Ni and Ni-base alloys on Mo, Cr on 18-8 stainless, alumina on alloys of iron, Ni, Mo, Co. (L-general, R1h; SGA-h)

266-L.* Porcelain Coatings on Steel. L. E. Fussell and H. P. Tripp. *Product Engineering,* v. 29, Feb. 17, 1958, p. 75-77.

Advantages of enameling cold rolled steel and firing at 1200 to 1400° F. Compares coating properties with enamels fired at conventional temperatures. Cause and correction of coating defects. (L27; ST)

267-L.* Bright Nickel Plating. Pt. 1. Basic Solutions. D. J. Fishlock. *Product Finishing,* v. 11, Jan. 1958, p. 48-62.

Origins and evolution of bright Ni solution; modified Watts-type solutions; effect of variety of addition agents on brightness. 35 ref. (L17a; Ni)

268-L. Influence of Mica on Impact Resistance Stoving Finishes. H. W. Chatfield. *Product Finishing,* v. 11, Jan. 1958, p. 70-73.

Use of ground mica for improving adhesion or for adsorbing or distributing internal stresses in a coating. (L26p, Q6n)

269-L. Production Buffing With Liquid Compositions. Pt. 2. H. L. Kellner. *Product Finishing,* v. 11, Jan. 1958, p. 74-77.

Factors controlling metal removal by buffing where liquid compound is sprayed on buffing wheel. (L10a)

270-L. Fabricating Continuous Galvanized Steel. Pt. 2. Tips on Using a Product With Wide Applications. Ernest W. Horvick. *Steel Processing and Conversion,* v. 44, Feb. 1958, p. 92-94, 103, 104.

(L16, Q23q; ST)

297-L.* Painting Hot Dip Galvanized Steel. J. F. H. van Eijnsbergen. *Industrial Finishing (London),* v. 10, Mar. 1958, p. 34-36.

Paints containing around 80% Zn dust and 20% vehicle have long been known for their excellent performance, for example, as coatings for water tanks. The Zn-rich paints for Zn dust compounds give a dry film containing 94-95% Zn dust and only 5-6% of a vehicle which is generally a synthetic resin. (L26n; ST, *Zn,* 8-65)

298-L. Metal Finishing in the Mining Industry. *Industrial Finishing (London),* v. 10, Mar. 1958, p. 37-39

(L26p, R-general, T28r)

299-L. Mechanized Roll Coating. Thomas A. Dickinson. *Industrial Finishing (London),* v. 10, Mar. 1958, p. 43-44.

Two electrically rotated coating rolls—horizontally aligned, one over the other—with automatic-feed units make it possible to coat either one or two surfaces of a flat material in a single pass. (L26, 4-53)

300-L.* Pickling, Descaling, and Derusting of Steels. W. Bullough. *Metallurgical Reviews,* v. 2, no. 8, 1957, p. 391-405.

Pickling theory, pickling of mild steel, electrolytic pickling, gas pickling, sodium hydride pickling, disposal of spent pickle liquor, other methods of descaling. 51 ref. (L12; ST)

301-L. Slide-Honing—a New Barrelling Technique. Charles Emerson. *Metalworking Production,* v. 102, Mar. 14, 1958, p. 453-455.

A precision technique which confines parts to sliding and rolling actions that remove stock accurately, without damage. (L10d)

302-L. Organic Finishes Over Metal Surfaces. Myron Perez. *Plating,* v. 45, Mar. 1958, p. 239-244.

Present and potential uses of epoxies, phenolics, acrylics and vinyl dispersion coatings. (L26p)

303-L. Fabricating Continuous Galvanized Steel. Tips on Using a Product With Wide Applications. Ernest W. Horvick. *Steel Processing and Conversion,* v. 44, Jan. 1958, p. 43-46.

Three basic methods of galvanizing are hot dip or "batch" galvanizing, continuous hot dip galvanizing, electro-galvanizing; specifications. (To be continued.) (L16; ST, *Zn*)

304-L. Electrophoretic Deposition of Plutonium. A. Feasibility Study. K. A. Walsh. *U. S. Atomic Energy Commission,* LA-2153, Jan. 1958, 13 p.

(L29p; Pu)

305-L.* Accelerators and Their Function in Phosphating Solutions. Lloyd O. Gilbert. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 73-78.

Acceleration by saturating solution with metals in form of ferrous and Mn salts and with heavy metals in form of Cu and Ni salts. Another method is electrolytic polarization. Compares reactions of nitrate and nitrate-nitrite, depolarizers and metal oxiders, solutions in bath and resulting coatings. 13 ref. (L14b)

306-L.* Latest Development in Electroplating With Ultrasonics. Stanley R. Rich. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 87-90.

Ultrasonics improve and accelerate the plating process. Applications are chiefly in Ni, Zn, Cr and Ag plating. Technique applied to Watts bath, fluoborate bath and a variety of proprietary bright Ni solutions. (L17, 1-74)

307-L.* Barrel Plating. Paul Glab. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 116-120.

Comparison of oblique and horizontal types of barrel plating. Pickling and cleaning, alkaline descaling by immersion and electrolytic process and activating of the metal. Recommended solutions, concentrations and operating conditions for Cd, Zn, Cu, brass, Ni and Fe plating. (L17, W3b, 1-52)

308-L.* Further Studies on Nickel-Iron Alloy Electrodeposits. I. W. Wolf. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 121-123.

Effects of 79% Ni, 21% Fe alloy plating parameters and thickness and use of alloy as a bright protective coating. Grain size and magnetic properties of very thin films. Current density, pH, and grain size as a parameter are poor. Plating was tested with salt spray. Pits and amount of oxide excreted from each pit were less for Ni-Fe coating compared with Ni coating from Watts bath. (L17; *Ni, Fe*)

309-L.* Iridium Plating and Its High Temperature Oxidation Resistance. James C. Withers and Paul E. Ritt. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 124-129.

Use in missiles and aircraft. Iridium plates could protect stainless steel from flaking and scaling and Mo from forming volatile oxide at high temperatures. Most successful conditions were developed using sodium cyanide and potassium cyanide in molten state. Iridium plating (0.0005 in. thick) keeps stainless steel from scaling when exposed for 30 min. at 1000° C. Thicker plates would offer complete protection of Mo at high temperatures. 3 ref. (L17, T24; SS, Mo, *Ir*)

310-L.* Surface Catalyzed Reduction of Copper. A. E. Cahill. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 130-131.

Deposition of thick Cu films by chemical reduction proved unsuccessful with hypophosphite but practical with formaldehyde. Three alkaline Cu tartrate-formaldehyde solutions were found to deposit Cu autocatalytically to produce thick films. Experiments suggest that Cu reduction takes place by the transfer of electrons through the metal film from species existing in the alkaline formaldehyde solution to Cu at another point on the metal surface. There is not always a 1:1 ratio between H_2 and Cu deposited. 4 ref. (L17; *Cu*)

311-L.* Sealing of Sulfuric Acid Anodic Films on Aluminum. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 132-142.

Methods included water sealing at various pH values and sealing times, steam sealing at atmospheric and 15 psi. in dichromate, molybdate, nickel acetate and silicone solutions. Molybdate seals with colorless coating and may be useful method. Extent of sealing was rated by weight gain on sealing, weight loss on immersion in cold sulphuric acid solution, cathodic current flow and resistance to acidified salt spray and outdoor exposure. 38 ref. (L19; Al)

312-L.* Role of Chromate Treatments in the Finishing of Aluminum. Walter E. Pocock. *44th Annual Technical Proceedings, American Electroplaters' Society,* 1957, p. 152-155.

Chromate treatment can often be substituted for anodizing. It requires no electrical current, short time for processing, no venting for tank, and operates at room temperature. Coating can be applied by immersion, brush or spray; dimensional change is negligible; control of bath is relatively simple. 5 ref. (L14c; Al)

313-L.* (English.) Study of the Anode Area in Electrolytic Polishing of Copper. Masao Naruse and Akira Nannichi. *Tohoku University, Technology Reports,* v. 22 no. 1, 1957, p. 29-39.

Consideration should be given to positional arrangement of the cathode, uniform distribution of current, cathode surface area. Bubbling during electropolishing, electrolyte convection and potential distribution in the cell should influence pole distance. If cathode area is too small, surface finish on the anode is unsatisfactory. With unchanged cell voltage, if the anode area decreases, the current density increases, and decreases as anode area and pole distance become greater. (L13p; Cu)

314-L.* (French.) **Recent Developments in Anodic Oxidation.** F. Flusin. *Alluminio,* v. 27, Jan. 1958, p. 13-18.

Review of developments in France in anodic treatment in bulk of small objects. Impregnation of porous castings with bakelite resin prior to anodic treatment reduces number of rejects. Bloom appearing on anodized surface of architectural Al exposed to industrial atmospheres. (L19; Al)

315-L. (German.) **Sand Blast Cleaning of Castings.** H. Koeller. *Giesserei-Praxis,* v. 75, Nov. 25, 1957, p. 489-495.

Proper selection of type and size of blast cleaning equipment depends on the work to be cleaned. Use of metal abrasives versus natural sand advised in most cases. Various models shown. (L10c; 5-60)

316-L. (German.) **Plating and Automation in Volkswagen Plant.** R. O. Becker. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Feb. 1958, p. 45-52.

To be continued. (L17, T21, 18-74)

317-L.* (German.) **Experimentation With Chemical and Electrochemical Removal of Chromium Plating From Copper.** W. Schlittgen. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Feb. 1958, p. 53-57.

Worn Cr plating from Cu printing plates was removed chemically in dilute hydrochloric acid at 50-60° C. Removal time decreases with increasing solution temperature. Test for electrolytic removing was performed in sodium hydroxide solution (8%) with and without bagging. Best results were obtained at a current density of 10-15 amp. per sq. dm. Solution attack on Cu base increases with increasing current density. (L12g, L13n; *Cu, Cr,* 8-62)

318-L.* (German.) **Electropolishing.** Siegfried Gruttner. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Feb. 1958, p. 58-62.

Process applicable to Fe, steel, Cu, Ni and Zn. Chromic acid bath used in pretreatment, followed by degreasing and rinsing. Bath compositions and current densities for polishing various metals. (L13p; CI, ST, Cu, Ni, Zn)

319-L. (German.) **Synthetic Rubber Products for Protection Against Corrosion.** St. Reiner. *Werkstoffe und Korrosion,* v. 9, Jan. 1958, p. 1-4.

7 ref. (L26r)

320-L.* **Slide Takes the Curse Out of Tumbling.** *American Machinist,* v. 102, no. 4, Feb. 24, 1958, p. 97-99.

Improved barrel confines parts to sliding and rolling actions that remove stock accurately, without damage. Various sizes of barrels are mounted at various angles on rotating face plate. Importance of proper angle and size of barrel, choice of abrasive compound and chips, experience of operator in controlling variables which gives desired finish. (L10d, 1-52)

321-L.* **Aluminum Coated Steel.** W. E. McFee. *Iron Age,* v. 181, no. 6, Feb. 6, 1958, p. 95-97.

Sheet steel coated on both sides with Al possesses surface characteristics of Al and physical and mechanical properties of steel. Materials resist atmospheric corrosion to serve a wide variety of outdoor products. Standard fabrication procedures for cold rolled steel must be modified. (L22, R3; ST, *Al,* 17-57)

322-L.* **High-Frequency Vibrations Slash Barrel Finishing Time.** *Iron Age,* v. 181, Feb. 20, 1958, p. 86-87.

New machine with standard barrel vibrates and rotates to give superior finish with ease and speed. This machine cuts finishing time to less than one-half the usual time, more than doubles the normal workpiece loads and successfully tumbles the "impossible" pieces. (L10d, 1-52)

323-L.* **How to Grind and Polish Stainless Steel.** *Metalworking,* v. 14, no. 3, Mar. 1958, p. 18-21.

Important advantages of stainless steel are lost if the finish is wrong. Equipment and procedures used to get any one of several different surface finishes. Special polishing techniques are used with stainless steel because finishes wanted by users often differ widely. (L10b, G18; SS)

347-L. Electroplating Explained. A Course for the Practical Plater. Pt. 1. Inorganic Chemistry. H. Hartley. *Product Finishing,* v. 11, Feb. 1958, p. 68-73.

(To be continued.) (L17; NM-a)

348-L.* Bright Nickel Plating. Pt. 2. Process Details. D. J. Fishlock. *Product Finishing,* v. 11, Feb. 1958, p. 80-94.

Current British practice in Ni plating; pretreatment, etching solutions, plant equipment, Ni anodes. 27 ref. (L17; *Ni*)

349-L. Post-War Development of the Tinplate Industry in Western Europe. Pt. 3. Belgium and the Netherlands. W. E. Hoare. *Sheet Metal Industries,* v. 35, Mar. 1958, p. 181-187.

(L13, L16, L17; *Sn*)

350-L. Application of Precoated Steel Sheets in Industry. E. Marks *Sheet Metal Industries,* v. 35, Mar. 1958, p. 195-201.

Production and uses of tinned, terne, lead and phosphate-coated sheets, blue-planished sheets, aluminized sheets and plastic-coated sheets. 11 ref. (L16, L14a, L14c; ST, 4-53)

351-L. Conductor Wire Plated Continuously. *Steel,* v. 142, Mar. 24, 1958, p. 118, 121.

Copper coating on steel core for telephone drop wire. (L17, T1b; ST, *Cu*)

352-L. (German.) **Corrosion Protection of High-Frequency Measuring Apparatus.** Werner Junge. *Feinwerk Technik,* v. 61, Dec. 1957, p. 427-430.

(L-general, X10)

353-L.* (German.) **Hard Chromium Plating and the Tool Industry.** Karl Schopper. *Industrieblatt,* v. 58, Feb. 1958, p. 40-44.

Advantages of Cr plated tools are less friction, higher stability, lower fluctuation of cutting strength, resistance to corrosion. Principal disadvantage is brittleness. Suitable steel for tools and various types of plating; examples; sharpening and heat treatment. (L17; TS, *Cr*)

354-L. (German.) **Automatic Washing and Etching Units for Up to Date Surface Treatment.** Heinz Anders. *Industrieblatt,* v. 58, Feb. 1958, p. 53-55.

Modern equipment for degreasing, etching, passivating, phosphating. Suitable chemical agents; handling equipment; dipping and spraying methods; combined degreasing-etching methods. (L12, 1-52)

355-L.* (German.) **Pickling of Brass Strips in Dilute Sulphuric Acid.** M. Stammler and F. Neumuller. *Metall,* v. 11, Nov. 1957, p. 945-947.

Pickling of brass with oxidized surface is performed through a reaction between the metal oxide and the acid. During the second reaction through an electrochemical process the dissolved Cu is precipitated and Zn dissolves. (L12g; Cu-n, 4-53)

356-L. (German.) **Protection Against Corrosion by Electroplating.** J. Elze. *Metall,* v. 12, Jan. 1958, p. 32-38.

Kind of material to be coated, surface finish, desired appearance, service conditions and cost determine choice of coating. Electrochemical reaction between base material and coating, information on right thickness and typical characteristics of various coatings. (L17)

357-L. (German.) **Anodizing and Its Application in Metal Structures.** M. Gottschalk. *Metall,* v. 12, Mar. 1958, p. 209-214.

Purpose and characteristics of anodic oxidation; selection of materials; technique of preparation, treatment and post-treatment. Control and care of finished parts; cost calculation; applications. (L19)

358-L. (German.) **Chemical and Electrolytic Polishing.** J. Heyes. *Technische Mitteilungen,* v. 50, Jan. 1957, p. 25-27.

8 ref. (L12, L13p)

359-L. (Russian.) **Effect of Electromechanical Scraping on Surface Layer of Iron.** B. M. Askinazi and B. G. Alekseev. *Vestnik Mashinostroeniya,* Feb. 1958, p. 59-61.

(L10h, S15; Fe)

360-L. Vapour-Blasting of Tools. *Aircraft Production,* v. 20, Feb. 1958, p. 61-63.

Tests in machining turbine blades with and without vapor-blasted tools to determine effect of process on lengthening tool life. (L10c, T6n)

361-L. Special Machine Anodizes Chevrolet Grille and Headlamp Bezel. *Automotive Industries,* v. 118, Feb. 1, 1958, p. 58-59, 115.

(L19, 1-52, T21c; Al-b)

362-L. Special Purpose Shot Blasting Installations. *Corrosion Prevention and Control,* v. 5, Mar. 1958, p. 55-58.

Four installations designed for mechanical cleaning of steel strip or large and unusual castings. (L10c; 4-53, 5-60, ST)

363-L.* Protective Coatings Based on Bitumen. John Stanford. *Corrosion Prevention and Control,* v. 5, Mar. 1958, p. 62-64.

Origin and use. Colored coatings formulated with synthetic resins, solvents and pigments. Aluminum metal flakes yield a good coating. (L26a; *Al*)

364-L. Precision Barrel Finishing of Aluminum Alloy Castings. E. A. Reynolds. *Industrial Finishing (London),* v. 10, Apr. 1958, p. 24-25.

(L17a; *Sn*)

367-L. Ceramic Coatings Prevent Corrosion. *Industrial Finishing (London),* v. 10, Apr. 1958, p. 40-42, 44, 46.

Research and development techniques in the use of ceramic coatings to protect metals from high-temperature atmospheric corrosion. (L27, R3n; NM-g34)

368-L. Is Automatic Hardfacing for You? Spencer Payne. *Welding Engineer,* v. 43, May 1958, p. 32-33.

Cost factors and limitations involved in hard facing of metal components subjected to heavy wear. (L24)

369-L. Spray and Fuse, a Popular Hardfacing Method. H. S. Gonser. *Welding Engineer,* v. 43, May 1958, p. 34-36.

Parts are grit blasted and coated with hard facing powder. The powder is then fused to form a molecular bond between coating and base metal. Method of determining maximum thickness of coating, details of preparation of parts. (L24)

370-L.* Filler Metals for Joining. Orville T. Barnett. *Welding Engineer,* v. 43, May 1958, p. 40-45.

Specifications, description, applications for 45 types of filler metals used in hard facing. (L24; SGA-f)

371-L (French.) **Causes, Remedies and Prevention of Silver Plating Defects.** Andre Saglier. *Galvano,* v. 27, Mar. 1958, p. 27-31.

(To be continued.) (L17, 9-70; *Ag*)

372-L. (French.) **Some General Remarks on Galvanizing.** A. Herz. *Metallurgie et la Construction Mecanique,* v. 90, Feb. 1958, p. 107-110.

(L16; *Zn*)

373-L.* (French.) **Ultrasonic Cleaning of Metal Parts and Optical Lenses.** Marcel Boyer. *Trempe,* no. 34, Jan. 1958, p. 28-33.

Equipment and application. 13 ref. (L10f)

374-L.* (German.) **Testing of Paint Coats.** D. Wapler. *Metalloberfläche,* v. 12, Apr. 1958, p. 113-119.

Modern state of paint coat testing. Relationship between working conditions and test conditions; methods of determining coat thickness; testing physical and mechanical properties of coats, testing stability. (L26n, 1-54; NM-g30)

375-L. (German.) **Concentration Changes in Electroplating Baths.** A. V. Krusenstjern and H. Schlegel. *Metalloberfläche,* v. 12, Apr. 1958, p. 119-122.

Experimental electrolysis for the purpose of examination of mechanism; importance of diffusion polarization. (L17a)

376-L.* (German.) **Effect of Welding Conditions on Compostion and Structure of Deposited Hard Chromium Alloys.** Helmut Koch and Elmar Bernholz. *Schweissen und Schneiden,* v. 10, Mar. 1958, p. 71-76.

Composition and structure of filler alloys; essentials for transformation hardness by martensite formation in basic structure; effect of welding conditions on hardness and wear resistance; use of double electrodes; phase diagrams. (L24, Q29; Q9n; *Cr*)

377-L. (German.) **Surface Treatment of Blooms and Intermediate Products by Means of Mechanical Flaming. Pt. 1.** H. E. Habbig and A. Pfeuffer. *Schweissen und Schneiden,* v. 10, Mar. 1958, p. 94-98.

Development of process and its mechanism; manual and mechanical flame treatment; types of machines; gas consumption. (L10g, 4-52)

378-L.* (Italian.) **Bright Chromium Plating of Light Alloys.** F. Sacchi. *Galvanotecnica,* v. 9, Jan. 1958, p. 1-16.

Prefinishing operations, including pickling, etching, undercoating with Zn, Cu, brass, Ni; final Cr plating; techniques and processes in Europe and U. S. A.; influence of pickling solutions, etchants, undercoatings on corrosion resistance and adherence of Cr deposits. 26 ref. (L17, L12g; Al, Mg, *Cr*)

379-L.* (Italian.) **Filling Blowholes in Castings by the Metallizing Process.** Gian Giacomo Caccia. *Rivista di Meccanica,* v. 9, Jan. 18, 1958, p. 55-58.

Metal spraying is more economical than other methods for salvaging large or complicated defective castings since only defective areas are treated. Preparatory steps and spraying techniques for repair of iron, carbon steel, stainless, brass, bronze and copper castings. (L23, E26)

380-L. (Russian.) **Facing With Hard Metals.** M. A. Tylkin and M. I. Kershtein. *Metallurg,* Jan. 1958, p. 5-6.

Fusing stalinite, sormite and metallic electrodes on working surfaces by electric arc considerably extends length of service of knives, spades and other implements. (L24)

381-L. (Russian.) **Reagent for Electrolytic Cleaning of Chromium-Nickel Austenitic Alloys.** Yu. B. Malevskii. *Zavodskaya Laboratoriya,* Jan. 1958, p. 111-112.

387-L. Automatic Plating for Automobile Components. *Metal Industry,* v. 92, Apr. 18, 1958, p. 313-316.

(L-general, T21c; 18-67, 18-74)

388-L. Metal Laminates Come of Age. Arvin Develops Processes for Drawing, Spot Welding and Plating Vinyl-Metal Laminates. *Modern Industrial Press,* v. 20, Apr. 1958, p. 19-20.

(L26p, K11d, 7-58)

389-L. Cleaning and Preparation of Metals Prior to Electroplating. Effect of Oxide Films. Pt. 10. Experimental Results. Henry B. Linford and David O. Feder. *Plating,* v. 45, Apr. 1958, p. 349-359.

Oxides were applied to degreased and hydrogen reduced Cu surfaces. Ni was plated from a high-pH Watts bath without allowing contact with air. 15 ref. (L12, L17; *Ni,* Cu)

390-L. Electroplating Research at the International Nickel Co. Research Laboratories. *Plating,* v. 45, Apr. 1958, p. 360-365.

(L17, A9h)

391-L. Bright Nickel Plating. Pt. 4. Deposit Characteristics. D. J.

Fishlock. *Product Finishing,* v. 11, Apr. 1958, p. 79-90.
17 ref. (L17a; *Ni*)

392-L. Electroplating Explained. A Course for the Working Plater. Pt. 3. Measuring Instruments. H. Hartley. *Product Finishing,* v. 11, Apr. 1958, p. 96-102.
(L17, X7a, X9n, X3n)

393-L. Plating Helps Titanium. *Steel,* v. 142, May 5, 1958, p. 102-104
Chromium plating overcomes galling and seizing tendencies. Cu and Ni are used as undercoatings. Missile makers use electrical and electroless methods.
(L17a, L28; Ti, *Cr, Cu, Ni*)

394-L.* Techniques for Coating Metals With Molybdenum. Seymour Senderoff. Paper from "The Metal Molybdenum", American Society for Metals, p. 199-213.
Of the three methods for producing Mo coatings, metal spraying, vapor deposition, and electro-deposition, only the first has had any commercial applications and these have been limited. Vapor-deposited coatings, by both the carbonyl and Mo pentachloride processes and electrodeposited coatings have been studied only in the laboratory. 20 ref. (L17, L23, L25; *Mo*)

395-L.* Protection of Molybdenum Against High-Temperature Oxidation. Julius J. Harwood. Paper from "The Metal Molybdenum", American Society for Metals, p. 420-461.
Most successful coating compositions that have been developed thus far center around the Ni-Cr alloy system. Both electroplated Cr-Ni layers and sprayed Ni-Cr alloys containing S and B have demonstrated a capacity to protect Mo up to about 2000° F. Sprayed mixed silicide layers also appear promising. 23 ref. (L17, L23; Mo)

396-L. New Method of Increasing the Wear Resistance of Tracks With Open Bushings. A. A. Maurakh. *Vestnik Mashinostroeniya,* v. 36, no. 12, 1956, p. 16-18. (Henry Brutcher Translation no. 3962, Altadena, Calif.)
Merits of boronizing to give maximum wear resistance to carbon structural steel. (L15, Q9a; ST, *B*)

397-L. Heat-Resisting Hard Iron-Chromium-Nickel Facings. G. Faber. *Schweizer Archiv,* v. 23, no. 1, 1957, p. 14-19. (Henry Brutcher Translation no. 4072, Altadena, Calif.)
Previously abstracted from original. See item 224-L, 1958.
(L16; Cr, Ni, Fe, SGA-m, 2-62)

398-L. (Czech.) Deposition of Chromium From Polychromate Baths. Vladimir Klapka. *Korose a Ochrana Materialu,* v. 1, no. 7-8, 1957, p. 101-107.
Chromium cannot be deposited from bichromate baths even if catalytic agents are used, but deposition is possible from the baths of other polychromates. Effect of the order of the polychromate and of the free chromic acid and sulphuric acid on the cathode efficiency. Effects of temperature, concentration of chromic acid and impurities (Cr_2O_3 and Fe_2O_3) on appearance of coatings from tetrachromate baths. (L17a; *Cr*)

399-L. (Czech.) Tin Plating of Cast Iron. Karl Janecky. *Korose a Ochrana Materialu,* v. 1, no. 7-8, 1957, p. 109-112.
The difficulties in the process and methods that facilitate the process. Explanation of formation of the tin coating on basis of the binary Fe-Sn diagram. Properties of the coating. (L17; CI, *Sn*)

400-L. (Dutch.) Protective Coatings for Very High Temperatures. F. Loos. *Lastekniek,* v. 24, Mar. 1958, p. 34-38.
"Rokide" flame spray method for applying a protective pure oxide coating of very high melting point. (L27; NM-a34)

401-L. (French.) Petroleum Bitumen for Protection of Underground Pipelines. H. Goldstein. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 315-322.
9 ref. (L26a; 4-60)

402-L. (French.) Thermal and Anticorrosion Insulation: A New Insulating Material Combining Both Properties. J. F. Williams and E. A. Blackwell. *Corrosion et Anticorrosion,* v. 5, Nov. 1957, p. 323-326.
Gilsonite coatings for pipes carrying hot gases. (L26, 2-62; 4-60)

403-L. (French.) Galvanizing Cast Iron. A. Hiscock. *Fonderie Belge,* v. 28, Mar. 1958, p. 79-87.
Advantages of cast iron with high silicon (3-4%) and phosphorus (1%). (L16; *Zn,* Cl, *P, Si*)

(L24, T28; 6-69)

418-L. Science for the Coatings Technologist. Pt. 9. Metallic Pigments. E. S. Beck. *Metal Finishing,* v. 56, Apr. 1958, p. 52-55, 57.

Aluminum, leafing and nonleafing aluminums, metallics, hammered finishes. (L26n, 17-57; Al, NM-g30)

419-L. Finishing Pointers. Chromium Plating Thickness. J. B. Mohler. *Metal Finishing,* v. 56, Apr. 1958, p. 58, 67.

Decorative, engineering, cutting and die applications. (L17; *Cr*)

420-L.* Cold Chromium Plating in Russia. A. J. Steiger. *Metal Finishing,* v. 56, Apr. 1958, p. 56-57.

Russian machine tool specialists have been employing an electrolyte for cold plating which requires 1/3 to 1/4 of the current density of the conventional electrolyte and has better throwing power. Best composition is said to be 250 g. per l. of chromic acid and 4 g. per l. of ammonium fluoride. Plating is done at 15 to 25° C. and current density of 8 to 12 amp. per sq. dm. (L17, 1-67; *Cr*)

421-L. New Vinyl Paint Facilities at Poughkeepsie IBM. Henry D. Bowen, Jr. *Metal Finishing,* v. 56, Apr. 1958, p. 59-61.
(L26p)

422-L.* Chemical Polishing. Pt. 2. Lester F. Spencer. *Metal Finishing,* v. 56, Apr. 1958, p. 62-67.

Three major processes are phosphoric-nitric, phosphoric-nitric-acetic and phosphoric-sulphuric-nitric acid mixtures. Main industrial application for chemical polished Al is as a pretreatment for decorative anodizing. Two types of finish may be

obtained; a highly polished mirror type obtained by the slower acting solutions; a bright finish with usually lower specular reflectivity than that exhibited in mechanically polished surfaces. 39 ref. (L12g)

497-L.* Priming Paints for Light Alloys. J. G. Rigg and E. W. Skerrey. *Institute of Metals, Journal,* v. 86, May 1958, p. 421-424.

At the end of a 10-year period, some of the paint systems on the light metals based on zinc chromate or zinc tetroxy-chromate primers require no more than cleaning or touching up. To a limited extent this is also true for paint systems based on iron oxide primers. Coatings based on red lead primer have not proved so useful. Zinc chromate and zinc tetroxy-chromate primer systems are preferred for composite structures of steel and light alloys. 4 ref. (L26n; EG-a39)

Use of an Al-Si alloy layer to retard interaction between Al and U and to promote the transfer of heat across the interface. A metallurgical bond can be achieved by dipping Al and U in the molten alloy; a thin adherent layer of the compound U(Al,Si) is formed at the interface which acts as an effective diffusion barrier up to about 350° C. 10 ref. (L23, T11g; Al, U)

503-L.* (Japanese.) **Cladding Light Metals.** Eihachiro Tanaka and Tadatsugu Yoshiki. *Light Metals (Tokyo),* v. 8, Mar. 1958, p. 44-52.

Cladding behavior of materials with different flow resistance. Good bonding can be obtained by hot rolling if the pair of metals is sufficiently reduced in the rolling pass. With hot extrusion, the inverted method is recommended. With cold rolling some cracking and rippling occurred. Bonding behavior improves with increasing individual thickness ratio, difference in hardness of outside material had no influence on cracking or rippling. Over-stretching of softer metal caused rippling which resulted in cracking of the harder metal. 6 ref. (L23; EG-a39, 9-72)

504-L. Skin-Polishing. R. D. Edwards. *Aircraft Production,* v. 20, May 1958, p. 192-197.

During the process of electrometallization, at the moment of fusion the metal becomes saturated with air. Particles of metal in the air current are spherical and vary greatly in size. The outside surface of these globules is covered with oxides. These oxides adversely affect the physical properties of the metallized layer. They can be greatly improved by proper heat treatment. 3 ref. (L23; ST)

An initial very thin plate of Cd is deposited on the metal; the piece is baked for a short time to drive off hydrogen; plated again to bring thickness to desired level. Initial plating prevents further hydrogen embrittlement. (L17c, Q26s; ST, Cd)

568-L.* (German.) **Dip Titanium Coatings on Iron.** M. E. Straumanis and Y. P. Huang. *Metall,* v. 12, June 1958, p. 501-503.

Titanium coatings on iron are extremely corrosion resistant, except for the pores left in the coating. To find the pores, an NaCl solution was used, resulting in yellow spots on the surface. The pores can be eliminated entirely through light scraping and subsequent treatment with an $AgNO_3$ solution. Of ten specimens thus treated eight proved to be corrosion resistant. 6 ref. (L16, 9-68; Fe, Ti)

569-L.* (German.) **Practical Applications for Bohmite Coatings.** D. Altenpohl. *Metall,* v. 12, June 1958, p. 503-507.

Bohmite is a gamma AlO OH crystallized aluminum oxydehydrate. It develops when Al reacts with water or vapor at about 75° C. and forms a strongly adhesive coating about 0.2 to 2 microns thick, which is corrosion resistant. This process is recommended for kitchenware and wrappings as well as for containers and pipes. Additions of ammonia or triaethanol-amine accelerate the coating process. Apparatus for this process is described and tables and diagrams are given for thickness of coating, growth rate and applications. 16 ref. (L21; Al-b)

570-L.* (German.) **Chemical and Electrochemical Surface Treatment of Molybdenum and Tungsten.** H. J.

Boosz. *Metall,* v. 12, June 1958, p. 508-511.

A survey of the literature covering chemical etching and polishing, electrochemical potential, electrolytic etching and polishing, electroplating from aqueous solutions and from melts, electroplating with Cu, Au, Ni and Cr. 63 ref.
(L-general; Mo, W)

571-L.* (German.) Applications of Precious Metal Coatings. H. W. Dettner. *Metall,* v. 12, June 1958, p. 520-522.

Precious metals, especially Au and Ag, are used increasingly as electroplate for electrical purposes. The electric conductivity of Ag is excellent. A special electrolytic passivating process was developed for Ag to prevent oxidation under H_2S. Au is not as conductive but is more corrosion resistant. The softness of Au was compensated through hard Au deposits at room temperature which are also more wear resistant. Rhodium coatings on Ag increase heat resistance. 8 ref.
(L17; Ag, Au)

572-L.* (Spanish.) Metallization of a Hydraulic Press Cylinder. Arnulfo Espinosa. *Fusion de Metales,* v. 20, Mar-Apr. 1958, p. 21-23.

Inside walls of press required to support 600 tons pressure were rust protected by application of ¼-in. bronze coating. (L23, W24g; Cu-s)

573-L.* Nitric Acid Cleaning of Sensitized Type 304 Stainless Steel. R. G. Christman. *Bettis Technical Review,* WAPD-BT-7, Mar. 1958, p. 121-123.

Cleaning of sensitized Type-304 stainless steels with 25% HNO_3 at 150° F. for as long as 16 hr. has no adverse effects. Care must be exercized to avoid residual acid deposits. (L12g; SS-b)

585-L. Dimensional Changes of Aluminum Alloy Articles in Anodic Oxidation. A. V. Shreider. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 83-93. (Translation by Consultants Bureau, Inc.)

Nature of the dimensional changes is determined by the anodizing conditions and chemical composition and structure of the metal. Dimensional changes are strongly influenced by the method of preparing the surface before anodizing and by the configuration of the anodized articles. For minimum dimensional changes in anodizing for corrosion protection of precision parts, the surface should be prepared by the use of organic solvents (and not alkaline solutions), and the anodic oxidation should be carried out in 3% CrO_3 solution at 34-42°, at 40 v. for 45-60 min. 61 ref. (L19p, P10d; Al-b)

586-L. Electrochemical Tinning of Sheet Iron From Halide Solutions. V. P. Kochergin, T. A. Nimvitskaya and M. Ya. Vyunova. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 95-100. (Translation by Consultants Bureau, Inc.)

An increase of the cathode polarization in electrodeposition of Sn from solutions of simple Sn salts can be effected by addition of complex-forming inorganic compounds. The fluorides of ammonium and sodium act as such complex forms in halide solutions. (L17a; Sn, Fe, 4-53)

587-L. Dependence of the Anode Potential of Steel on the Electrolyte Composition in Electrochemical Polishing. N. P. Fedotyev and S. Ya. Grilikhes. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 239-244. (Translation by Consultants Bureau, Inc.)

(L13p; ST)

588-L. Electrochemical Liberation of Zinc on Aluminum Cathodes With Differently Treated Surfaces. D. P. Zosimovich and T. I. Kononchuk. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 245-253. (Translation by Consultants Bureau, Inc.)

Principal factor determining adhesion of Zn to Al is absence or presence of an oxide film on the Al surface. When an Al cathode is immersed in an electrolyte containing fluoride ions, the oxide film on the electrode surface is attacked and Zn is deposited on it. While the film remains thick, the metals will not adhere. Different states of the oxide film on the Al surface and different fluoride-ion contents lead to different rates at which the film is dissolved, and hence to differences in adhesion between the metals. 35 ref. (L17; Al, Zn)

589-L. Electrolytic Copper Plating From Ammoniacal Electrolyte for Local Protection of the Surface of Steel Articles in the Cementation (Carburization) Process. N. A. Marchenko. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 255-260. (Translation by Consultants Bureau, Inc.)

Ammoniacal electrolytes can be successfully used for direct Cu plating of steel parts for local protection of the surface against carburization. Operating conditions; room temperature, cathode current density 2-3 amp/dm^2, anode current density with soluble Cu anodes 2-3 amp/dm^2. 6 ref. (L17a; Cu, ST)

590-L.* (Italian.) **Coloring of Anodized Aluminum.** C. Pieri. *Alluminio,* v. 27, June 1958, p. 267-271.

Coloring of anodic coatings with synthetic coloring matter depends primarily on physical absorption phenomena which occur between electropositive Al oxide and electronegative coloring substance. In some cases (e.g., Al lacquers with phenolic colorants), chemical phenomena will also be present. General characteristics which colorants should have for different applications. (L19q; Al-b)

591-L.* (Italian.) **Painting of Light Alloys Used in Naval Construction.** R. Ferrero. *Alluminio,* v. 27, June 1958, p. 273-275.

Electrochemical corrosion of light alloys used in ship building; required characteristics of protective paints; resin-base paints which have given excellent results in actual use. (L26, R4b; Al-b, Mg-b)

592-L.* (Italian.) **Pretreatment of Metal Surfaces Prior to Painting.** *Pitture e Vernici,* v. 14, Mar. 1958, p. 233-236.

Mechanical, physical, chemical and ultrasonic methods of surface preparation. (L10, L12)

593-L.* (Spanish.) **Experimental Study of a New Metal-Coating Process.** Con-

tinuous Semi-Industrial Installation for Aluminum Coating of Iron Wire by Immersion in a Fused Electrolyte. Manuel Serra. *Revista de Ciencia Aplicada,* v. 12, May-June, 1958, p. 222-237.

Solutions were worked out to mechanical, metallurgical and chemical problems common to all immersion coating processes. For each bath composition a critical operating temperature was observed which coincides with temperature at which minimum thickness of intermetallic sub-layer is formed. Baths containing Cr, Mo and Be together provided coatings of best ductility, brightness and uniformity of surface. 9 ref. (L16; Fe, Al, 4-61)

594-L.* The Influence of Aluminum, Lead and Iron on the Structure and Properties of Galvanized Coatings. J. J. Sebisty and J. O. Edwards. *Mines Branch Research Report R5, Department of Mines and Technical Services, Ottawa,* Mar. 14, 1958, p. 1-47.

Immersion time and Al content of the bath had the most significant effect on such factors as coating weight, steel weight loss, iron content and alloy growth in the coating, and ductility and adherence of the coating. The bath temperature was also significant but to a lesser degree. The lead content of the bath was the most significant variable affecting coating appearance. (L16, 2-60; ST, *Al, Pb, Zn)*

595-L.* (Russian.) **Electrolytic Polishing of Machine Parts.** V. A. Zhikh. *Vestnik Mashinostroeniya,* v. 38, June 1958, p. 58-60.

New metal finishing method by use of electrolytes with direct current. Electrolytes consist of concentrated acids, usually sulphuric acid. The workpiece serves as anode and insoluble lead rod serves as cathode. 5 ref. (L13p)

596-L. Descaling and Cleaning of Titanium and Titanium Alloys. D. W. Stough. Battelle Memorial Institute (Office of Assistant Secretary of Defense), *U. S. Office of Technical Services,* PB 121640, Mar. 1958, 68 p. $1.75.

Acid pickle baths are generally used to remove scales formed at temperatures up to about 1100° F. Above this more drastic treatment is needed, such as molten salt treatment followed by acid pickling. Proprietary descaling methods; and descaling practices at the major producers of mill products. (L12g, L12h; Ti-b)

597-L. Automatic Hard Surfacing of Complex Curves. *Industry and Welding,* v. 31, July 1958, p. 37.

New automatic machine cuts manhours 40% and surfaces better, faster and more uniformly. Sampling, rework and distortion are reduced. A twin-arc oscillating welding head was mounted on a radial manipulator. (L24, 1-52)

598-L. Conveyor Allows Random Choice of Anodizing Treatment. Robert Nyquist. *Iron Age,* v. 182, July 31, 1958, p. 51-53.

Use of projections on anodizing racks and trip switches at appropriate steps in the cycle permits automatic selection or skipping of any desired step. (L19, W3g, 1-52)

599-L. American Can Opens Coil Stock Plant in Hammond, Ind. *Iron and Steel Engineer,* v. 35, July 1958, p. 142-143.

World's first plant devoted exclusively to processing tin and steel plate from coils for manufacture of metal cans will perform two basic functions—chemical coating of steel plate (black plate) for use in "tinless" cans, and shearing of huge coils of both tin plate and chemically treated plate into can-making sheets. (L16, 1-52, F29q, ST, *Sn,* 4-53)

600-L. Barrel Plating Is Finding Its Place. D. J. Fishlock. *Metalworking Production,* June 27, 1958, p. 1115-1121.

Suitability of work for barrelling depends on skill of the plater, and availability of a variety of work which can be mixed to give suitable loads. A certain amount of burnishing must be expected and angular parts may become appreciably eroded. Uniformity is less satisfactory than in vat plating. (L17)

601-L. Protection of Springs Made of Steel No. EI 723 Against Oxidation at High Temperatures. T. I. Volkova and Yu. N. Griboedov. *Metallovedenie i Obrabotka Metallov,* May 1958, p. 37-40. (Henry Brutcher, Altadena, Calif., Translation no. 4222.)

Flat springs made of this steel are recommended for labyrinth packings in steam turbines. They functioned well up to 550° C., but beginning at 500° C. they became covered with scale. Various metallic glazes were tried and best results were obtained from a mixture of 60% metallic chromium, 39% alumina and 1% ammonium iodide. (L27, R1h, 2-62; ST)

602-L. Aluminum Coating of Iron by Vaporized Aluminum Chloride. S. A. Semenkovich and A. V. Smirnov. *Metallovedenie i Obrabotka Metallov*, May 1958, p. 48-51. (Henry Brutcher, Altadena, Calif., Translation no. 4225.)

Corrosion resistance of mechanical parts may be considerably increased by treatment with monohalogens of Al. Under action of vaporized aluminum chloride a hard, heat resistant coating is formed on iron surfaces at 950 to 1000° C. Apparently an intermetallic compound, Fe_2Al, is formed. At higher temperatures the coating becomes softer and probably is made up of the eutectic mixture of Fe_2Al_5 and $FeAl_3$. 12 ref. (L25; Fe, *Al*)

Dynamic viscosities of various flux materials, such as zinc chloride, alkaline systems, ammonium chloride and ammine-type systems. Addition of alkali halides or ammonium chloride decreased the viscosity of zinc chloride. Oxides increased viscosity after saturation of the homogeneous solution. With iron oxide the degree of oxidation is of particular influence. Diagrams for viscosities given. 14 ref. (L16, P10f; RM-q, Zn, Sn, Pb)

607-L. (German.) **Investigations on the Formation of Protective Coatings During Cathodic Polarization of Steel Surfaces.** Heinrich Klas. *Archiv für das Eisenhüttenwesen*, v. 29, May 1958, p. 321-328.

Formation of protective coatings from $CaCO_3$ and $Mg(OH)_2$ on steel parts through cathodic polarization and their properties in diluted and undiluted ocean water, in acid and acid-free drinking water and in earth-type solutions. Current density-time diagrams and resistance-time diagram. Debye-Scherer photographs were taken, with $Mg(OH)_2$ and $CaCO_3$ as calibrating substances. Recommendations for correct polarization and protective potentials. (L21; ST)

Results indicate that it is essential to distinguish electrochemical grinding, accompanied by smoothing of the metal surface and electrochemical polishing, accompanied by an increase of the reflecting power of the metal. Smoothing of the microroughnesses of the metal surface in electrochemical grinding is the result of formation of a viscous salt layer near the anode or a salt film on the surface. (L13p)

Procedure for correcting flaws of the oxide film on various parts made of Al alloys, by point anodizing with direct and alternating current in sulphuric acid and chromic acid electrolyte. Method is simple, cheap and dependable under conditions of aircraft production and operation. (L19; Al-b)

682-L.* Anodic Polarization of Titanium in Nonaqueous Base Etching Solutions. Morris Eisenberg and Robert E. DeLaRue. *Electrochemical Society, Journal,* v. 105, Mar. 1958, p. 162-169.

Anodic polarization studies, coupled with rate studies as a function of current density, represent a reliable method for determination of the suitability of an electrolyte and of the optimum operational conditions; temperature and current density for anodic etching of Ti without causing a detrimental hydrogen embrittlement of the metal. 7 ref. (L13q; Ti-b)

683-L.* Finishing Die Castings. Pt. 6. Plating. E. G. Carlson. *Precision Metal Molding,* v. 16, Aug. 1958, p. 39-41.

The poor performance of Cu, Ni or Cr-plated die castings subjected to outdoor exposure is due to deposits which were thinner than specifications called for. Other reasons for failure include porosity, unsound castings, pitting or porosity in the electroplated deposit itself. Duplex Ni deposits over Cu improve the corrosion properties of the overall plating. (L17; 5-61, Cr, Cu, Ni)

684-L. (Russian.) **Effect of Anodic Passivation Method and Electrolyte Concentration on Porosity of Al_2O_3 Film.** A. F. Bogoyavlenskiy and N. V. Siletskaya. *Zhurnal Prikladnoi Khimii,* no. 8, 1956, p. 1295-1297.

Studies of porosity of anodic Al_2O_3 films formed on sheets of Al (D-16-T) alloy by the sulphuric acid, chromic acid and the carbonate methods. Porosity was determined by filling with mineral oil. Porosity of films formed by the sulphuric acid and carbonate method increases with increasing concentration of the electrolyte, while that of films formed by the chromic acid method is little dependent on the concentration. (L19, 9-68; Al)

685-L.* Application of the Ion Bombardment Cleaning Method to Titanium, Germanium, Silicon and Nickel as Determined by Low-Energy Electron Diffraction. H. E. Farns-

worth, R. E. Schlier, T. H. George and R. M. Burger. *Journal of Applied Physics*, v. 29, Aug. 1958, p. 1150-1161.

Ion-bombardment cleaning has been successfully applied to the (100) faces of Ge, Si and Ni, and to the (0001) face of Ti. The method is capable of producing surfaces which are atomically clean.
(L13, M22h; Ti, Ge, Si, Ni)

686-L. Can Vacuum Metallizing Replace Plating? *Metalworking*, v. 14, July 1958, p. 8-9.

(L25g; Al)

687-L. Phosphating Teatments. Patent Literature Survey. E. C. Tinsley. Rock Island Arsenal Laboratory. *U. S. Office of Technical Services*, PB 131356, Apr. 1957, 148 p. $3.75.

(L14b, 10-54)

688-L.* Coatings for Underwater Metal Surfaces in Fresh Water Exposures. Sol M. Gleser. *Corrosion*, v. 14, Aug. 1958, p. 377t-386t.

Tests to determine effectiveness of coats for underwater metal surfaces on lock and dam components along upper Mississippi River. Data on pigmentation formulas, pigment-vehicle ratios, vehicle composition, preparation of metal surfaces and longevity of primer and finished coats. Suitability of various vehicles, use of coal tar, asphalt, hot spray metal coatings, Al and rubber coatings. 4 ref.
(L26a, L26r, L26p, L26n, R4a)

689-L.* (German.) Present Status of Aluminum Bright Anodizing. R. Lattey. *Aluminium*, v. 34, July 1958, p. 382-389.

Theoreticl basis of bright (eloxal) anodizing in which Al surfaces are brightened and subsequently anodized without substantial loss of brightness. The uppermost metal layer is removed after mechanical polishing by chemical brightening or anodic solutions. Brightening effect is checked by measurements of reflection and by interference photographs. Important anodic and chemical brightening baths and process procedures. Possible applications. 10 ref.
(L12f, L13p, L19; Al-b)

690-L.* (German.) Chromate Coating of Aluminum. H. Ketterl. *Aluminium*, v. 34, July 1958, p. 398-405.

Corrosion resistance and other properties of chromte coatings. Performance compared with washed primers. Chromate coatings as base for enameling. Techniques in using Alodine-100 and Alodine-1200 baths. 26 ref. (L14c; Al-b)

691-L.* (German.) Procedures for Anodizing and Dyeing Aluminum for Architectural Applications. Pt. 1. G. E. Gardam and A. W. Brace. *Aluminium*, v. 34, July 1958, p. 392-397.

General conditions for anodizing and dyeing structural Al parts. Al alloys suitable for anodizing. Dyes recommended including certain stable inorganic pigments and organic dyes of medium stability. Sealing procedures. Unsatisfactory results of some practical appilcations due mainly to insufficient coating thickness and sealing.
(L19n, T26n, 17-57; Al-b)

692-L.* (German.) Effect of Polishing Materials on Luster in Barrel Polishing. M. Dreher. *Metallwaren-Industrie und Galvanotechnik*, v. 49, May 1958, p. 188-194.

Changes caused by chemical factors. Metal barrels can produce a harmful electrochemical potential, so barrels of rosin and acid-free aged wood are suggested. Chemical properties of water can influence the result. Choice of polishing compound determined by material of parts. The part surface should be free of oxides, sulphides and stains. The polishing material should not attack the surfaces of the parts or the balls, and should have good antifriction, foaming and emulsifying capacities. All remainders of pickling fluid should be washed way before polishing. (L10d, W3b)

693-L. Hydrogen Overpotential on Electroplated Copper-Tin Alloys. I. A. Ammar and H. Sabry. *Journal of Physical Chemistry*, v. 62, July 1958, p. 801-805.
(L17; Cu, Sn)

694-L. Finishing Big Parts in Barrels. *Precision Metal Molding*, v. 16, Aug. 1958, p. 43.

A modification of the standard barrel whereby the barrel or chip container is stationary and the workpieces are moved, but movement is not rotational. Parts are fixtured and movement between them and the chip-mass is secured by a reciprocating movement in a horizontal plane. Parts 5 ft. long and weighing from 50 to 52 lb can be finished. (L10d)

695-L. (Russian.) **Point Anodizing of Aluminum Alloys.** V. G. Kononenko and D. A. Lyukevich. *Trudy Khar'kovskogo Aviatsionnogo Instituta,* no. 16, 1955, p. 27-36.

Procedure for correcting flaws of the oxide film on various parts made of Al alloys, by point anodizing with direct and alternating current in sulphuric acid and chromic acid electrolyte. (L19; Al-b)

696-L. Western Electric's Modern Metal Finishing Plant. A. W. Cagle and E. J. St. Amand. *Metal Finishing,* v. 56, Aug. 1958, p. 48-52.

Equipment and layout at the new Lexington Rd. plant, Winston-Salem, N. C. (L-general, 1-52, 18-67)

697-L. Phosphating Treatments. A Comprehensive Patent Literature Survey. Pt. 5. Ervin C. Tinslev. *Metal Finishing,* v. 56, Aug. 1958, p. 70-72.

Fifty-six U. S. patents briefly annotated. (L14b)

698-L. Science for Electroplaters. Pt. 39. Organic Acids. L. Serota. *Metal Finishing,* v. 56, Aug. 1958, p. 73-75, 81.

(L17)

699-L. (Russian.) **Excessive Porosity of Electrodeposited Metals.** Ya. E. Geguzin. *Fizika Metallov i Metalovedenie,* v. 5, no. 3, 1957, p. 536-544.

14 ref. (L17, 9-68; Cu)

700-L. (Pamphlet.) **Bibliography on Electroplating Cobalt and Cobalt Alloys.** F. R. Morral. 16 p. 1958. Cobalt Information Center, Battelle Memorial Institute, 505 King Ave., Columbus 1, Ohio.

Encompasses literature on the electroplating of cobalt and its binary and ternary alloys to June 1957. (L17; Co, 11-67)

701-L.* Organic Finishing of Aluminum and Its Alloys. Lester F. Spencer. *Metal Finishing,* v. 56, Aug. 1958, p. 58-61, 69.

Procedures used in painting Al differ from those used for steel; the largest variable is the manner in which the surfaces are prepared for painting. Various types of finishes. 7 ref. (L26; Al)

702-L. Ceramic Coatings for Protection of High-Temperature Materials. Nathaniel Cannistraro. Paper from "Sheet Materials for High Temperature Service", American Society for Metals, 1958, p. 25-36.

Variety of coatings available can be grouped into three basic types: Coatings for low-carbon or low-alloy steels; stainless steels of either AISI 300 or 400 series; or super high-temperature alloys. Applications include coatings on engine parts such as combustion chambers, inlet guide vanes, turbine blades, afterburners and tail cones. (L27; CN, AY, SS, SGA-h)

703-L.* (French.) **Diffusion of Aluminum and Beryllium in Nickel and Nickel Alloys and the Protection Provided Against the Effect of Hot Gases.** H. Buckle and J. Moisan. *Recherche Aeronautique,* no. 64, May-June, 1958, p. 27-33.

Solubility of Al and Be in Ni is too low to provide good corrosion resistance to solid solutions obtained by conventional diffusion processes. With new diffusion technique, Al or Be-rich coatings composed of definite compounds (AlNi, $AlNi_3$, BeNi, Be_2Ni) can be applied to Ni and Ni alloys. Coatings obtained have Vickers hardness of 500 to 1500 kg. per sq. mm. and provide perfect protection against oxidation in open air up to about 1100° C. Al_xNi_y films are only slightly brittle, but in combustion gases they deteriorate at temperatures over 800° C. as a result of chemical reaction. Be_xNi_y coatings are chemically stable in combustion gases up to about 850° C., but have low ductility. 8 ref. (L15; Ni, *Al, Be,* SGA-h)

704-L.* Electropolishing. What, How and Why. John F. Jumer. *Metal Finishing,* v. 56, Aug. 1958, p. 44-47.

Surface conditions, regardless of metal or alloy, determine to a large extent the degree of successful electropolishing. Greatest contributing factors towards unsatisfactory results are: large grain size, nonuniform structure, nonmetallic inclusions, directional roll marks, salt or scale contaminations, overpickling and insufficient or excessive cold reduction. Fine-grained deposits are more important than bright electroplated items when electropolishing for true reflected finishes. (To be continued.) (L13p)

705-L.* An Introduction to Vacuum Metalizing. M. A. Self and John Scharnberg. *Metal Finishing,* v. 56, Aug. 1958, p. 54-57.

Parts to be metallized with Al are usually given a resin-base coat. Al staples are hung on W wire filaments near the center of a vacuum chamber. The temperature of the filaments is raised to 1200° F., which causes the Al to melt and flow over the filament surface. An increase in temperature to 1800° F. evaporates the Al which then radiates from its source, coating all areas in a direct line with a thin film. Comparison with Cr plating. (L23; Al)

706-L.* (Japanese.) **Visual Inspection of Paint Film and Choice of Paint.** Yuji Tsuji. *Metal Finishing Society of Japan, Journal,* v. 9, May 1958, p. 21-26.

Odor, dryness, runs, sags and grain are inspected during painting. After painting, color, odor, brush mark, bubbling, pinholing and wrinkling are inspected. 48 ref. (L26n, S13d)

707-L. Preparation of Protective Coatings by Electrophoretic Methods. A. C. Werner and R. J. Abelson. Vitro Corp. of America. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131726, Feb. 1958, 26 p. $.75.

Process for depositing alloys to serve as intergranular diffusion barriers between the Mo base and the Ni-Cr layer. Multi-layer coatings of 80-20 Ni-Cr and Ni-bonded columbium and titanium carbide provided good oxidation and erosion resistance. The ballistic impact resistance requirement was fulfilled by inclusion of a 50% dense, 80-20 Ni-Cr. (L29p; Mo, *Ni, Cr,* SGA-h)

708-L.* (German.) **Anodic Behavior of Different Type Nickels in Plating Baths. Pt. 2.** E. Raub and A. Disam. *Metalloberfläche,* v. 12, July 1958, p. 193-197.

Examination of the electrolytic polarization of different Ni anodes by anodic dissolution. Rolled Ni anodes show high polarization; electrodeposited fine-grained Ni anodes show low polarization. When similar anodes are used, pure chloride baths give the lowest polarization, while bright baths show the highest. Measuring the anodic electrolytic efficiency showed slight differences, but in all cases was close to 100%. Sludge formation was smallest for rolled Ni anodes. (L17b; Ni)

709-L.* Some Observations on Aluminizing of Steel. A. N. Kapoor, A. B. Chatterjea and B. R. Nijhawan. *Indian Institute of Metals, Transactions,* v. 9, 1955-1956, p. 167-181.

Mechanical deformability of hot-dip aluminized steel depends on the characteristics of the alloy layer. Growth of the alloy layer at a particular temperature was roughly parabolic, being governed by an empirical relationship which is given. Presence of other elements in the bath appeared likely to affect diffusion so the influence of Fe, Si, Cu, Ti, Zn and misch metal either singly or in conjunction were investigated. Presence of 0.25% misch metal with 0.4% Ti and 2% Si gave preferred coating. 11 ref. (L16, 2-60; ST, *Al*)

710-L.* Aluminizing of Steels by the Aqueous Flux Process. S. M. Arora, P. K. Gupte and B. R. Nijhawan. *Indian Institute of Metals, Transactions,* v. 11, June 1958, p. 57-72.

Flux is applied by dipping the article in a strong, hot aqueous solution of potassium fluoride containing traces of hydrochloric acid. Drying of fluxed material leaves a protective, oxide reducing and air-excluding film of salt. Preheated articles are then dipped in the molten Al bath maintained between 710-760° C. and withdrawn after 15-30 sec. During hot dipping in molten Al, potassium fluoride reacts in the bath forming potassium cryolite which diffuses away to the surface allowing clean steel to come in contact with molten Al. 16 ref. (L16; ST, *Al*)

711-L.* (German.) **Surface Protection by Whirl Sintering and Flame Spraying.** Erwin Gemmer. *Werkstoffe und Korrosion,* v. 9, July 1958, p. 421-423.

Whirl sinter apparatus for dip coating of metals with thin plastic. Flame spraying a plastic powder on heated metal. Sand blasting, wash primer and chemical treatments for the preparation of surfaces. Pigmenting and coloring methods; automation of whirl sintering processes. (L26p, L10, L12)

712-L.* (German.) **New Protective Silica Coatings on Metal Surfaces.** O. Loebich. *Werkstoffe und Korrosion,* v. 9, July 1958, p. 423-424.

New silica coating "Inverron" for metal surfaces can be applied easily, is noncombustible and resists temperatures up to 400° C. Shows good chemical resistance and does not injure metal luster. (L26; *Si*)

713-L.* (Italian.) **Anodic Oxidation of Light Alloys and Architectural Applications.** A. M. Bertazzoli. *Alluminio,* v. 27, July-Aug. 1958, p. 331-336.

History of industrial use of anodic oxidation in Italy; process; common defects in anodic coatings and methods of inspection and control; standards and quality, responsibility of suppliers of anodized items. (L19; Al)

714-L.* (Italian.) **"Victor Cromalugraf" Aluminum Printing Process.** *Alluminio,* v. 27, July-Aug. 1958, p. 342-344.

New decorative process can be used on bare Al in any of its possible finishes and on painted or anodized metal; provides permanent designs and colors for indoor and outdoor applications. Examples of architectural panels and smaller items for home, industry and office. (L26b, T26n; Al)

715-L.* **Hard Oxide Coatings on Aluminum Investigated.** *Industrial Finishing,* v. 10, July 1958, p. 36-37.

Effects of hard oxide coatings on properties of Al and its alloys. Corrosion resistance, abrasion resistance and stress-rupture tests were made. Effects of various coating treatments on abrasion resistance and effects of treatments on bending fatigue. (L14a, Q9, R-general; Al)

716-L.* **Application of Vitreous Enamels to Non-Porous Surfaces.** *Industrial Finishing,* v. 10, July 1958, p. 47-49.

Ways of applying coatings and advantage of each. Types of coatings, including various decorative finishes. (L27)

717-L.* (Japanese.) **Studies on Aluminum Enameling. Pt. 3. Pretreatment of Aluminum Plate for Borosilicate System Frit.** Toshio Yamada and Shinichiro Tomino. *Metal Finishing Society of Japan, Journal,* v. 9, June 1958, p. 206-210.

Effect of anodic treatment of Al plates to aqueous solution of borates or silicates prior to application of enameled frit on adhesion of enamel, impact bending and thermal shock tests. Lithium borate, sodium borate, water glass and potassium borate were effective for anodic treatment. Binary mixtures such as lithium borate and water glass gave even better results. Ternary mixtures also were effective. 5 ref. (L27; Al)

718-L.* (Japanese.) **Electrodeposition on Anodic Coating of Aluminum. Pt. 5. Electron-Microscope Observation of Anodized Coating.** Matsuhei Kishi. *Metal Finishing Society of Japan, Journal,* v. 9, June 1958, p. 213-217.

Structure of anodic coatings produced by anodizing Al in phosphoric acid, oxalic acid and sulphuric acid. Influence of bath composition, bath concentration, voltage and treatment time on porosity and structure. 7 ref. (L19, M27; Al)

719-L.* (Japanese.) **Studies on Aluminum Enameling. Pt. 4. Effect of Li_2O on Borosilicate System Frit.** Toshio Yamada and Takashi Sugiyama. *Metal Finishing Society of Japan, Journal,* v. 9, June 1958, p. 217-222.

Effect of varying Li_2O content from 1 to 10% in enameling frit for Al on adhesion, wetting power, gloss, corrosion resistance and thermal shock resistance of the enamel. Enamel with larger amounts of Li_2O gave the best performance when subjected to impact, bending, thermal shock and corrosion tests. 4 ref. (L27, Q-general; Al)

720-L.* **Babbitting of Cast Iron.** *Foundry Trade Journal,* v. 105, Sept. 4, 1958, p. 295-296.

Kolene process removes sand, scale, rust and grease from castings, as well as dissolving the graphite on and immediately below the surface, creating a chemically clean surface for tinning. (L12n; CI, SGA-c)

721-L.* **New Hard Coat for Aluminum.** *Steel,* v. 143, Sept. 22, 1958, p. 80-81.

Process gives porous oxide coating up to 0.006 in. thick, with wear resistance greater than anodized finishes. Costs slightly more than anodizing, less than Cr plating. (L14a, L19; Al)

722-L. Guide to Electrodeposited Coatings and Other Surface Treatments for Metals. D. E. Couch and J. W. Hensley. Naval Ordnance Test Station. *U. S. Office of Technical Services,* PB 131496, Sept. 1954, 29 p. $.75.

Quick, reliable guide to the properties and uses of electrodeposited metals and to other chemical and

electrochemical treatments used in metal finishing. Rapid evaluation of electrodeposited metals and other surface treatments. Definition of terms. Characteristics of electrodeposits, electrodeposited coatings, special chemical and electrochemical processes and special coloring processes for decorative and photographic purposes. (L17, Q-general)

723-L.* (Japanese.) **Hydrogen Overvoltage of Nickel-Phosphorus Electrodes in Alkali Solutions.** K. Sasaki and K. Sugiyama. *Chemical Society of Japan, Journal,* v. 61, June 1958, p. 650-655.

Electrodes prepared by the electroless method are used. Hydrogen overvoltage is observed in relation to time, current density and bath temperature. (L17; Ni)

724-L.* (Japanese.) **Experiments With Clear Lacquer Coating on Plated Zinc Die Castings.** Masahiro Uga. *Metal Finishing Society of Japan, Journal,* v. 9, June 1958, p. 210-213.

Variety of clear lacquers was applied to plated Zn die castings to compare adhesiveness and corrosion resistance of the lacquer coatings. A vinyl lacquer was found to be most practical. (L26n; Zn, 5-61, 8-12)

725-L. (Russian.) **Effect of Technological Factors on Porosity of Electrolytic Nickel Deposits.** G. S. Vasil'yeva. *Materialy po obmenu opytom i nauchnymi dostizhpniyami v meditsinskoi promyshlennosti,* no. 3, 1957, p. 31-42.

The effect of preliminary treatment (mechanical and chemical), composition of electrolyte and conditions of electrolysis on the porosity of Ni deposits. It was found that the better the mechanical treatment of the surface the less is the porosity. Passivation of the surface prior to Ni plating decreases the protective properties of the coating. Porosity is increased on contamination of the electrolyte with Fe and dextrin. (L17, 9-68; *Ni*)

726-L. **Six Ways to Safeguard Good Appearance, Long Life.** *Industrial Finishing,* v. 10, no. 121, July 1958, p. 28-29.

Cleaning methods during and after fabrication which safeguard the important qualities of stainless steel. (L10, L12, 17-52; SS)

727-L. **Good Finishing Is 'Keynote' to Accuracy.** *Industrial Finishing,* v. 10, no. 121, July 1958, p. 40-41.

Heat treating and various finishing processes used in producing a high-quality typewriter. (L-general, J-general, T10f, 1-61; ST, Ni)

728-L. **Continuous Galvanizing of Steel Strip.** *Metallurgia,* v. 58, Aug. 1958, p. 76-79.

New Armco-Sendzimir line installed at the Ebbw Vale works of Richard Thomas and Baldwins Ltd. (L16; *Zn,* ST; 4-53)

729-L. **Which Finish for Zinc Diecastings?** Roy Stricklen. *Metalworking Production,* v. 102, Aug. 15, 1958, p. 1431-1433.
(L-general; Zn, 5-61)

730-L. **Glass-Protected Steel.** *Product Engineering (Design Digest),* v. 29, Sept. 1958, p. C10-C11.

Corrosion prevention up to 1500° F., with good adhesion and dielectric properties. (L27; ST, NM-g34)

731-L. (German.) **Influence of Biologically Polluted Waters in Electroplating.** K. Sommer. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Aug. 1958, p. 351-352.

Importance of proper filtration of water used in electroplating plants. Quick growing algae and fungi affect appearance (threadlike deposit under microscope) and quality of finishes. (L17, W10h, 9-71)

732-L. (Italian.) **Bonderizing of Light Alloys.** P. de Cerma. *Alluminio,* v. 27, July-Aug. 1958, p. 337-340.
(L14b; Al, Mg, Ti)

733-L.* **Choosing a Finish for Zinc Die Castings.** Raymond Stricklen. *Precision Metal Molding,* v. 16, Sept. 1958, 67-69, 80.

Guide to mechanical finishing: polishing, buffing, tumbling and burnishing; chemical coloring and polishing; electroplating—zinc, zinc chromate, copper-nickel-chromium; organic lacquers and enamels. 5 ref. (L-general; Zn, 5-61)

734-L.* **Metal Bonded Media for Barrel Finishing.** *Precision Metal Molding,* v. 16, Sept. 1958, p. 74-75.

Mixture of abrasive and Cu powders was formed into pellets in a die and the resulting parts sintered. When pellets lodged in holes or channels they were easily re-

moved by dissolving them in a solvent that would not attack the metal from which the part being polished was made. There was no noticeable fracturing, rate of media wear was slow, rate of cut was rapid and the surface finish produced was satisfactory. A comparison is made with aluminum oxide media. Superiority of the metal powder to produce small radii is clear. (L10d, W2a; NM-j)

735-L. The Nitric - Hydrofluoric Acid Pickling of Zircaloy-2. E. Burt Friedl, Warren E. Berry, Paul D. Miller and Frederick W. Fink. Battelle Memorial Institute. *U. S. Atomic Energy Commission, BMI-1270,* June 11, 1958, 34 p.

Acid concentration, bath contamination, and temperature investigated. Pickling rates were found to be linear with time. Contamination of the bath with metal ions found in Zircaloy-2 at concentrations below saturation also had little or no effect on the pickling rate. 3 ref. (L12g; Zr-b)

736-L. Descaling and Cleaning of Titanium and Titanium Alloys. D. S. Stough, H. S. George, E. B. Friedl, W. K. Boyd and F. W. Fink. Battelle Memorial Institute. *U. S. Office of Technical Services,* PB 121640, Mar. 1958, 68 p. $1.75.

Scales formed on Ti and Ti alloys that have been heated in air up to about 1100° F. are generally removed by acid pickle baths. More drastic treatment is usually required when the metal is heated in air to above 1100° F. Proprietary descaling methods. Descaling practices at the major producers of mill products, such as billet, bars, plate, and especially sheet. (L12; Ti)

737-L.* Uniform Coatings Put on by Pressure Curtain Application. P. C. Bardin. *Industrial Finishing,* v. 34, Sept. 1958, p. 8-16.

New method, called "pressure curtain", of applying protective and decorative coatings on flat, curved, concave, fluted or molded surfaces of wood, metal and plastic products is fast and economical. Principle of "pressure curtain" application and the machine. Through the thin curtain of flowing material the uncoated stock is moved by flat conveyor belts. (L26n, 1-52)

738-L.* Protective Coatings for Steel. Pt. 1. Louis J. Nowacki and E. R. Mueller. *Industrial Heating,* v. 25, Sept. 1958, p. 1810, 1812, 1814-1816.

Selection and application of organic coatings, or paints. Types of coatings classified and characteristics of specific materials in each category related to present applications. (To be continued.) (L26; ST)

739-L.* Special Finishes and Their Uses. B. M. Letsky. *Product Finishing,* v. 11, Sept. 1958, p. 46-53.

Formulation and applications of various types of industrial finishes using lacquers. (L26n)

740-L.* (German.) **Anodizing.** Filip Schutra. *Metallwaren-Industrie und Galvanotechnik,* v. 49, July 1958, p. 275-279.

Anodized parts present excellent base for lacquer, synthetic resins, organic and inorganic dies. Preparation of Al before anodizing; mechanical buffing, polishing, chemical treatment when used for decorative purposes. Preparation of material; proper mounting of parts; volume and condition of baths, rinsing. Direct-current sulphuric acid method used for pure Al and Al alloys with 15% Si, or up to 20% total of Cu, Mg, Mn or Zn. Coloring between anodizing and sealing. Done by dipping, alternating between two baths with thorough rinsing in between. Coloring with gold and bronze. 9 ref. (L19; L14; Al)

741-L.* (German.) **Metal Cleaning as Physico - Chemical Problem.** Paul Westphal. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Aug. 1958, p. 312-320.

Complete cleaning means removal of all foreign matter (including oxides and other compounds of basic metal; metal chips and flakes; residues of polishing agents, oils and greases). Cleaning methods must be adapted to matter to be removed. Most material can be dissolved in related (heteropolar and homopolar) agents; for mixed group alkaline solutions can be used. Ideal cleaning solution would be one in which pickling, deoxidizing, degreasing and polishing (chemically or electrolytically) could be done at the same time. 8 ref. (L12)

742-L. (German.) **Degreasing of Metals in Plating Technology.** R. Weiner. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Aug. 1958, p. 320-336.

Necessity of careful cleaning of metal surfaces; degreasing does not include removal of oxides and other compounds of basic metal but deals with removal from surface of "impurities" mostly resulting from preceding operations. If two degreasing procedures needed, second degreasing always done electrolytically. Two basic methods are dissolving and emulsifying. These are always supplemented by mechanical methods (movements of parts in dipping; bubbling effects in boiling solutions; steady flow of solutions around and over parts by way of pumps; spraying of solution on parts). Advantages and disadvantages of different methods.
(L12, L17)

743-L.* (German.) **Degreasing and Cleaning of Steel Parts Before Applying Nonmetallic Coatings.** H. Rogner. *Metallwaren-Industrie und Galvanotechnik,* v. 49, Aug. 1958, p. 337-342.

Alkaline solutions (inorganic salts mostly supplemented by soaps and emulsifiers) and organic solutions or solution compounds are used for degreasing; for deoxidizing and acid substances. Passivating agents may be acid, alkaline or neutral. For deoxidizing and rust removing the cheapest agents are hydrochloric acid and sulphuric acid, supplemented by inhibitors; sometimes phosphoric acid is used which forms a protective layer on surface.
(L12; ST)

744-L.* **High Speed Brass Plating.** E. J. Roehl. *Electroplating and Metal Finishing,* v. 11, Sept. 1958, p. 299-301.

New process for plating brass on steel strip is capable of operation at substantially higher speeds. Brass-coated and lacquered strip steel is used for the fabrication of hand-bag frames, curtain rods, pencil ferrules, etc. (L17; ST, Cu-n)

745-L.* **Hot Galvanizing Practice in the U. S. A.** A. T. Baldwin and W. H. McMullen. *Electroplating and Metal Finishing,* v. 11, Sept. 1958, p. 319-322.

Production of better coatings and a reduction in the amount of Zn lost in dross by-products. New methods to increase ductility, adherence and appearance of the coatings. (L16, 1-66; *Zn*)

746-L. Diffusion of Aluminum and Beryllium in Nickel and Nickel Alloys. H. Buckle and J. Moisan. *Engineers' Digest,* v. 19, Aug. 1958, p. 336-338.

New diffusion process by means of which surface layers of definite compounds of Al and Be (AlNi, $AlNi_3$, and BeNi, Be_4Ni) can be applied on Ni. Behavior of these layers at high temperatures in air and in the presence of combustion gases. 7 ref. (L15; Ni, *Be, Al*)

758-L.* An Investigation of the Mechanism of Levelling in Electrodeposition. S. A. Watson and J. Edwards. *Institute of Metal Finishing, Transactions,* v. 34, 1956-1957, p. 167-198.

Levelling power, defined as a function of the deposit thickness obtained at the peaks and the recesses of a standard rough surface, is measured in Ni plating solutions. Effects of levelling power and cathode potential of variations in current density and in the concentration of a variety of addition agents. Cathode efficiency determined and distribution of addition agents investigated under selected levelling conditions. (L17b; *Ni*)

759-L.* A Contribution to Knowledge of the Cathode Polarization Phenomena of Nickel. R. Piontelli and G. Serravalle. *Institute of Metal Finishing, Transactions,* v. 34, 1956-1957, p. 293-316.

Cathodic behavior of Ni in various solutions (chloride, sulphate, chloride-sulphate, sulphamate, perchlorate, fluoborate) buffered with boric acid in different conditions of pH, current density and temperature. 15 ref. (L17, P15; Ni)

760-L.* Applications for Alkaline Descaling Cleaners. Edward R. Jorczyk. *Metal Finishing,* v. 56, Oct. 1958, p. 46-48, 55.

Typical production applications are removing heat treat scale from ferrous sheet metal parts other than stainless steel; removing carbon smut from partially Cu-plated ferrous alloy parts that are carburized; removing smut from parts that are stripped of Cu plate; cleaning parts prior to plating; removing rust from machined parts. (L12k)

761-L.* Electropolishing. Pt. 3. Less Commonly Electropolished Metals. John F. Jumer. *Metal Finishing,* v. 56, Oct. 1958, p. 67, 70.

Procedures and solutions for electropolishing cadmium, gold, magnesium, platinum, silver, tantalum, titanium, tungsten, zinc and zirconium. (L13p; Cd, Au, Mg, Pt, Ag, Ta, Ti, W, Zn, Zr)

762-L.* (German.) **Testing of Rhodium Baths by the Hull Method.** S. Dorner and L. Froels. *Metallwaren-Industrie und Galvanotechnik,* v. 49, July 1958, p. 299-305.

Rhodium is well suited for electroplating, and use in production of jewelry and precision instruments is increasing. Plating is similar to procedure in electroplating with other metals. Results of tests made with different metallic admixtures to baths. Damaging effects of Au, Cu, Ag. Sn and Zn. 4 ref. (L17; Rh)

763-L.* Multi-Color Finishes Applied Electrostatically. John Sedlacsik, Jr. *Industrial Finishing,* v. 34, Oct. 1958, p. 22-24, 28, 30.

System utilizes an array of airless variable-speed centrifugal atomizers for blending and atomizing different single solid color coating materials which are individually supplied at controlled rates to the inner bottom surface of each atomizer head by separate, variable-output, positive-feed displacement pumps to produce smooth multicolor effects. Process is capable of coating practically any products that can be moved through painting zone by conveyor. (L26n)

764-L.* The Hydra-Spray Process of Applying Paint Materials. John P. McAdams. *Industrial Finishing,* v. 34, Oct. 1958, p. 58-60, 62.

In this system, compressed air drives the pump, but it doesn't spray the paint. No compressed air reaches the spray gun; only thing that's fed to spray gun is paint under high pressure. This high pressure (1000 to 2000 lb.) is obtained from a reciprocating, double-acting air motor that is mechanically coupled by a connecting rod to a reciprocating, double-acting pump. (L26n)

765-L.* Electrodeposition of Gold and Platinum by Sel-Rex Processes. *Industrial Finishing (London),* v. 10, Sept. 1958, p. 37-38.

Gold plating can be applied for decoration and protection. Sel-Rex process is suitable for still and barrel plating. Important application is the plating of Cu printed circuits to protect them against corrosion and wear. (L17; Au, Pt)

766-L.* Electroplating Improves Properties of Iron Powder Articles. *Industrial Finishing (London)*, v. 10, Sept. 1958, p. 50, 52, 54.

Performance of various electroplates on iron powder parts. High-density and resin-impregnated parts have better corrosion resistance after plating than low-density parts. Copper in resin-impregnated parts reduces corrosion resistance. Acid sulphate bath produces better Cu deposits than a copper cyanide solution. Nickel sulphamate and zinc sulphate baths produce the best Ni and Zn plates. (L17; Fe, 6-72)

767-L.* New Way to Descale Titanium. *Products Finishing*, v. 23, Oct. 1958, p. 42-44.

Electrolytic process called "Ti-Brite". Formulation of the bath; hydrofluoric acid; nitric acid; sulphuric acid; water ferrous sulphate. The Ti article to be descaled is made the cathode and direct current (6 to 36 volts) is passed for 1-3 min. from this cathode to a Ti or ferrous metal anode. Current is reversed for 1-3 min. and then reversed again to pass current in the same direction first used. Treatment is continued until visual inspection shows that scale removal is such that remaining scale will be taken off in the rinse with a minimum of hand labor. (L13n; Ti)

768-L.* Properties and Uses of Catalytic Coatings. John F. Howe. *Products Finishing*, v. 23, Oct. 1958, p. 45-47.

Catalytic protective coatings are combinations of vehicles and rust-inhibitive pigments with a catalytic agent. They make possible a chemical treatment and rust-inhibitive coating in one application. Excellent adhesion and wetting properties, heat resistance, salt spray resistance and acid and alkali resistance. Used for all types of metal such as steel, stainless steel, Zn, Cd, Sn, Al, galvanized iron, Mg. (L29, R10b)

769-L.* (Czech.) Anodes for Chromium Plating With Baths Containing Hydrofluoric Acid. Otakar Mudroch. *Korose a Ochrana Materialu*, v. 2, no. 3-4, 1958, p. 45-48.

Experiments with anodes of different material and steel cathodes at 20-30° C. and with 10 amp. per sq. dm. anodic density. Pb-Sn alloy anodes, Pb-Sb and Pb-Sn recommended for anodes as well as for both tank linings. (L17, W3h, 17-57, Pb, Sn, Cr)

770-L. Self-Adhesive Tapes in Metal Finishing. *Electroplating and Metal Finishing*, v. 11, Sept. 1958, p. 303-308.

Types available and their principal characteristic. (To be concluded.) (L-general, R10f)

771-L. 'Ghosts' in the Saddle Department. Kerry Sloane. *Electroplating and Metal Finishing*, v. 11, Sept. 1958, p. 323-324.

Elimination of gray streak in the enamelled finish of bicycle frames. (L26n, 9-71)

772-L. Want Longer Part Life? Try Hardsurfacing. *Metalworking*, v. 14, Oct. 1958, p. 10-11.

Mild steel dust collector protected with ¼-in. welded hard surfacing is expected to last 6-8 times longer; create fewer maintenance problems. (L24; CN)

773-L.* The Influence of Aluminum, Lead and Iron on the Structure and Properties of Galvanized Coatings. J. J. Sebisty and J. O. Edwards. *Dept. of Mines and Technical Surveys, Ottawa, Canada, Mines Branch Research Report no. R5*, Mar. 1958, 47 p. $.25.

Influence of Al and Pb additions in iron-saturated baths on the structure and properties of galvanized coating prepared by dry galvanizing technique. Different levels of Al and Pb, and ranges of bath temperature and immersion time were studied using two grades of sheet steel. Statistical evaluation indicated that immersion time and Al content had most significant effect on coating rate, steel rate loss, Fe content and alloy growth in coating and in adherence of coatings. Pb content was most significant variable affecting surface appearance of coating. Accelerated corrosion tests suggest Al, and to a lesser degree Pb, had significant effect on promoting "white rusting" of coatings. 9 ref. (L16, 2-60; ST, *Zn, Al, Pb, Fe*)

774-L.* A Study of Surface Carbides, Differential Steel Attack and Pore Formation in the Galvanizing Process. J. J. Sebisty. *Dept. of Mines and Technical Surveys, Ottawa, Canada, Mines Branch Research Report no. R6*, Mar. 1958, 18 p. $.25.

Observations on effect of massive carbide inclusions present in steel sheet on the structure of galvanized

coatings. Behavior of carbides found to be dependent on temperature and Al content of galvanizing baths. Variation in galvanizing attack on two supposedly similar steels was found to be related to type and degree of surface working. Pore defects on the surface of coatings appear to be related to gas evolution accompanying flux reaction. (L16, 9-71; ST, *Zn*)

775-L.* New Protective Finishes for High-Temperature Resistance Materials. Alfred F. Hofstatter. *Product Finishing*, v. 11, Oct. 1958, p. 52-58.

Protective finishes for high-temperature materials include metallic coatings, paints and ceramic coatings. Base materials include Al, Mg and Ti alloys, alloy steels, stainless steels, Ni and Co alloys and Mo. Depending on the conditions of use, some of these may need no protection, while other conditions may call for some form of protective coating. (L-general; SGA-h)

776-L.* (Russian.) **Protective Coatings for Heat Resistant Alloys.** V. A. Parfenov. *Metallovedenie i Obrabotka Metallov*, June 1958, p. 33-37. (Henry Brutcher, Altadena, Calif., Translation no. 4251.)

Chromium plating 0.1 mm. thick on samples made of EI437B alloy increased their heat resistance by 16% at 750°, and 0.1-0.2 mm. thick plating on alloy EI 617 by 14% at 800°. Since electrolytic layers recrystallize at 800°, Cr plating is not recommended above that temperature. Enameling increases heat resistance of alloy EI 617 by 15% at 800°. For greater effectiveness enamel should be baked on the parts at low temperatures. 5 ref. (L17, L27; SGA-h, *Cr*)

777-L.* (Russian.) **Wear Resisting Chromium Plating of Worm Gears.** E. F. Zommer. *Vestnik Mashinostroeniya*, v. 38, Sept. 1958, p. 54-56.

Experiments conducted with aim of replacing bronze with cast iron. Specimens coated with porous and nonporous chromium gave adequate wear resistance Porous Cr gives best results. Cr plated gray iron is a good substitute for bronze. 4 ref. (L17, T7a, 17-57; CI, 18-12, *Cr*)

778-L. Influence of the Working Method on Growth and Various Characteristics of the Oxide Layer When Anodically Oxidizing in Sulphuric Acid. D. Lenz. *Aluminium*, no. 3, Mar. 1956, p. 126-135. (Special Libraries Assoc. Translation Center, John Crerar Library, Chicago, Translation no. ASLIB-GB39.)

(L19; Al-b)

779-L. Science for the Coatings Technologist. Pt. 11. Paint Additives: Driers and Anti-Skinning Agents. E. S. Beck. *Metal Finishing*, v. 56, Oct. 1958, p. 56-60.

Cobalt, lead, manganese, calcium, iron and zirconium used as drier metals.
(L26; Co, Pb, Mn, Ca, Fe, Zr)

780-L.* Electropalting Explained—a Course for the Working Plater. Pt. 5. Trichlorethylene Degreasing. H. Hartley. *Product Finishing*, v. 11, Aug. 1958, p. 60-67, 78.

Proper operational methods and safety devices insure against health dangers and unnecessary trichlorethylene wastage. Principles and operations of vapor, vapor-liquid and swill-type tanks. Rates of contamination and irrigation. (L12j)

781-L.* Staining of Copper Sheet and Strip and Its Prevention. W. H. L. Hooper. *Sheet Metal Industries*, v. 35, Aug. 1958, p. 611-613, 619.

Classifies the various types of stains according to their principal chemical characteristics, such as oxide and basic carbonate, sulphate, sulphide and redeposited metallic Cu. Methods of minimizing staining of Cu and their disadvantages.
(L12; Cu, 4-53)

782-L.* (French.) **Chemical and Electrochemical Finishing in the Automobile Industry.** R. Vacher. *Corrosion et Anticorrosion*, v. 6, Sept. 1958, p. 318-328.

When decorative effect as well as corrosion protection is desired for steel, Zn alloy, Cu or brass parts, Cr plating is indicated. For Al or Al alloy parts, anodic oxidation, including proper surface preparation, is sufficient. When no decorative effect is desired, Zn, Cd or Sn plating, or phosphate coating, provides corrosion protection. Surface preparation, bath characteristics, properties conferred on metal surface by these processes.
(L17, L19, L14b, T21, 17-57)

783-L.* Organic Coatings for Zinc Surfaces. P. Costelloe and E. Page. *Institute of Metal Finishing Bulletin*, v. 8, Summer 1958, p. 107-114.

Current commercial paint resins and their performances on Zn surfaces. Primers and wash primers and the effect of certain pigments. Formulation of chromate and phosphate passivation. (L26; Zn)

784-L.* Notes on the Application of Self Mottle Ground Coats. A. T. Issitt. *Product Finishing,* v. 11, Aug. 1958, p. 48-54.

Coats which are a mixture of regular or acid-resisting ground coat enamel and a super opaque Ti cover coat enamel give good resistance to thermal shock and abrasion. When a high proportion of white enamel is used in the mixture a Ni dip undercoat will give the ground coats good adhesion. Pickling, Ni dip solutions, cleaning, dipping equipment and layout, methods of dipping and procedures in applying these coats. (L27)

785-L.* (French.) **Corrosion Protection of Bridges and Viaducts of French National Railways.** Bernard Thomas. *Corrosion et Anticorrosion,* v. 6, Sept. 1958, p. 288-291.

Standard treatment for all metal structures of French lines consists of blast cleaning with crushed silica, brush application of a coat of pure red Pb, followed by one or two coats of heavy paint containing micaceous iron oxide. New anticorrosion paints and techniques are being tested, but results have been discouraging in test applications where atmospheric humidity and impurity are high.
(L10c, L26n, T26p; ST)

786-L.* Architectural Anodizing. *Light Metals,* v. 21, Oct. 1958, p. 328-329.

Recommendations for finishes of satisfactory appearance and long life are based on research into anodizing procedures, on weathering over prolonged periods in different environments and on the recently issued specifications for anodic films. Aluminium alloys used, texture, anodizing conditions, coloring and sealing. (L19, T26n, 17-57; Al)

787-L. An Engineering Study of Vacuum Metallizing. *U. S. Office of Technical Services,* PB 131542, Dec. 1956, 32 p. $1.

Feasibility of using the economical vacuum metallizing process in lieu of electroplating for coatings on ordnance material, with emphasis on electrical components. Rapid production of extremely thin metallic films on glass, metals and plastics. Al, Cr, Ti and Ni can be deposited in thin coatings (to 0.0001 in.) by use of W wire filaments. Multiple strands of W wire were used to produce thicker coatings but difficulties arose concerning the high temperatures required and the tendency of the charge metals to alloy with the filament material. L23, 1-73)

788-L.* Preparation and Properties of Clean High-Area Metal and Alloy Evaporated Films for Use in Surface Studies. S. J. Stephens. Paper from "1957 Fourth National Symposium of Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 34-37.

Preparation of films of Pd, Au and 60-40 and 80-20 Au-Pd alloys. Films characterized by chemical analysis, X-ray and electron diffraction studies and surface area measurements. Oxygen uptake by evaporated films.
(L25j, 1-73, M22; Pd, Au, 14-62)

789-L.* Evaporation Mode of Certain Vacuum Metal Distallation Source Configurations. L. E. Preuss and C. E. Alt. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 47-72.

Technique permitting qualitative survey and quantitative assay to be made of the distillation rate from the various regions of a simple metal evaporation source. Image formation achieved by condensation of radioactive metal distilland at image plane of a simple vacuum distillation camera. Autoradiographic process utilized to intensify metal image. The influence of surface tension, wetting, filament temperature and system pressure on distillation geometry studied for Au, Cr and W. (L25j, 1-73)

790-L.* Metallizing of Flexible Substrates. Phillip J. Clough. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 136-137.

Problems encountered in continuous metallizing of paper or plastic sheet material. Use of carbon-base crucible and evaporation of Al at high steady rate for periods of hours. Conditions for minimum heat transfer to substrate. Geometric arrangement of source to assure uniformity of coating. (L23, 1-73; *Al*)

791-L.* Vacuum Metallizing on Plastics. T. J. LaBounty. Paper

from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 138-142.

Plastics commonly metallized and characteristics that are important to commercial metallizer. Problems commonly encountered.
(L23, 1-73; NM-d)

792-L.* Continuous Evaporation of Refractory Metals by Electron Bombardment Without Using Support Materials. Norman Milleron. Paper from "1957 Fourth National Symposium on Vacuum Technology Transactions", Pergamon Press, N. Y., 1958, p. 148-149.

Mo and Ti wires evaporated at rate of 0.05 g. per min. Wires bombarded with electrons after being fed through cool Cu tips. The cool tip permits a stable continuously evolving molten ball of metal to be held by surface tension on the parent wire. 8 ref.
(L25g; Mo, Ti, 4-61)

793-L.* Electroplated Metals on Niobium. John G. Beach. Paper from "Technology of Columbium (Niobium)", John Wiley & Sons, Inc., N. Y., 1958, p. 81-88.

Plating baths and conditions for plating Fe, Ni, Cr, Cu, Au and Pt on Cb. Adherence of as-plated metals; heat bonding at 1300° F.; diffusion characteristics of Cr or Cu and Fe on Cb at 1500° F. The as-plated adherence of Fe was improved by heat bonding. At 1500° F. Fe plate ultimately alloyed with Cb and formed a weak intermetallic alloy layer. 5 ref. (L17, Cb)

794-L. Sprayed Aluminum Reduces Compressor Clearances. Loyd E. Batchelor. *American Machinist,* v. 102, Oct. 20, 1958, p. 140-141.

Automatic metal spraying process that minimizes the blade-to-housing clearance in turboprop aircraft engine compressors.
(L23, L10c, T24b; Al, 18-74)

795-L. Lead Base Paints in Corrosion Control. N. J. Read. *Corrosion Prevention and Control,* v. 5, Sept. 1958, p. 61-64, 66-67.

(L26n; Pb)

796-L. Metal Spraying Applications. *Industrial Finishing (London),* v. 10, Sept. 1958, p. 34-36.

Besides providing a protective coating, metal spraying can be used to build up worn parts such as bearings, hence saving the cost of replacement. (L23, Al, Cr, Ni, Zn)

797-L. Non-Porous Platinum Electroplate in One Operation. *Industrial Finishing (London),* v. 10, Sept. 1958, p. 39.

Platanex produces a nonporous Pt electroplate, in any practical thickness, directly from the bath in one continuous operation. Fine-grained dull gray finish duplicates exactly the surface plated; offers greater corrosion resistance in high-temperature ranges than Rh plate, at no greater cost. Baths are simple and easy to operate, requiring only addition of replenisher concentrate and water for maintenance.
(L17; Pt)

798-L. Fluoride Anodizing Process Replaces Shot Blasting for Magnesium Alloys. *Industrial Finishing (London),* v. 10, Sept. 1958, p. 56.

Magnesium alloys can be cleaned with little pretreatment. Dimensional losses are small and no difficulties arise even when working to fine limits. (L13n, L19; Mg-b)

799-L. Sulphamic Acid Bath Solves Nickel Plating Problems. *Industrial Finishing (London),* v. 10, Sept. 1958, p. 58.

Nickel plate from sulphamate acid baths is free of tensile stress and is used in the processes of magazine printing, printed circuits, typewriter components, gramophone records and aircraft parts. (L17a; *Ni*)

800-L. Automatic Parts Washer at Ford Motor Co. Plant. Emil J. Frundel. *Industrial Finishing,* v. 34, Oct. 1958, p. 54, 56.

8 ref. (L10d; NM-j)

813-L.* (German.) **Wire Tinning With and Without a Protective Salt Surface.** *Draht*, v. 9, Aug. 1958, p. 304-306.

Experiments with various tinning baths, especially with increased lead and a salt mixture consisting of 40 parts $NaNO_2$, 7 parts $NaNO_3$ and 53 parts KNO_3. No advantage seen in the use of a protective salt surface because small metal drops penetrate into the salt layer and increase the waste metal. (L16; ST, *Sn*, 4-61)

814-L.* (German.) **Vacuum Metallizing.** W. Koehler. *Metalloberflache*, v. 12, Sept. 1958, p. 262-267.

Materials suited for this process are glass, ceramics, porcelain, metals, most plastics, textiles, certain leathers, furs and special papers. Less suitable are materials containing larger amounts of softeners or solvents. The vapor pressure of material should be below the depositing pressure of 10^{-4} Torr, and no more gas should be liberated than the pumps can easily exhaust. 25 ref. (L23, 1-73)

815-L.* (Russian.) **Bright Copper Plating From Acid Baths.** V. P. Persianstseva, N. T. Kudryavstsev and V. M. Kalb. *Metallovedenie i Obrabotka Metallov*, v. 4, Sept. 1958, p. 42-46. (Henry Brutcher, Altadena, Calif., Translation no. 4357.)

Process uses an electrolyte containing 250 g. per l. $CuSO_4;5H_2O$; 50 g. per l. H_2SO_4; 0.005 g. per l. thiourea and 0.5 g. per l. sodium salt. Current during deposition 10 amp. per sq. dm. Temperature of electrolytes 15-22°. Plating has hardness of 250 kg. per sq. mm. Application of this process to shaped

parts has resulted in three-fold increase in productivity of Cu acid baths and has greatly shortened the time of production cycle of three-layer plate. (L17; *Cu*)

816-L.* (Russian.) **Improving the Surface Quality of Metal by Electro-Mechanical Process.** B. M. Askinazi. *Metallovedenie i Obrabotka Metallov,* v. 4, Sept. 1958, p. 49-53. (Henry Brutcher, Altadena, Calif., Translation no. 4359.)

Use of electromechanical polishing for work hardening machine part surfaces, using as test specimens steel 40Kh, 62 mm. in diameter and 25 mm. long. Some of the specimens were normalized and some quenched in water at 830° followed by annealing at 550°. Results show cleaner, harder surfaces with greatly increased wear resistance. (L13p; ST)

817-L.* **Electro-Polishing Aluminum Reflectors.** J. Nugent. *Electroplating and Metal Finishing,* v. 11, Oct. 1958, p. 352-353.

Use can be made of the gas flow in Brytal treatment to facilitate polishing of Al aircraft reflectors. The same applies to the chemical brightening of Al and to the bright dipping of brass in aqua fortis. Addition of caustic soda prolonged the life of the Brytal solution indefinitely and improved the polish obtained. (L13, L16, L19p; Al-b, Cu-n)

818-L.* **Bright Nickel Plating of Leaded Brasses and Bronzes.** Gianluigi Galli. *Electroplating and Metal Finishing,* v. 11, Oct. 1958, p. 354-355.

Lack of raw materials in Italy and their high costs has led to the employment of metals of inferior quality which cause difficulty in electroplating. Chemical drop tests on brass and bronze determine the presence of certain constituents such as Pb and Al. Condition of the surface, crystal structure and porosity of bronze or brass castings influence the adhesion of bright Ni plating. (L17b; *Ni,* Cu-n)

819-L.* **Vapour Deposited Coatings for Titanium and Titanium Alloys.** Andre Styka. *Industrial Finishing (London),* v. 10, Oct. 1958, p. 41, 43, 45, 47, 49.

Molybdenum was deposited on Ti by the decomposition of Mo hexacarbonyl in 40 different runs. The optimum Co:H_2 ratio seems to be approximately 3:1. Techniques developed produced adherent Mo coatings. Qualitative wear tests show that Mo coatings on Ti and Ti alloys have excellent wear resistance. (L25; Ti-b, *Mo*)

820-L.* **Sprayed High Melting Point Metals.** J. Cauchetier. *Metal Industry,* v. 93, Oct. 31, 1958, p. 374-375.

Mo, Mo alloys, W, Ti and Ta sprayed on sand-blasted, mechanically polished and electrolytically polished mild steel. Oxidation and adhesion of the layers. (L23; ST, *Mo, Ti, Ta*)

821-L. **Hard Facing.** R. T. Phillips. Paper from "Conference on Welding Engineering", *U. S. Office of Technical Services,* PB 131739, 1957, p. 179-202.

Characteristics of hard facing rods. Alloys are divided into five broad classifications; low-alloy Fe-base rods; high-alloy Fe-base rods; Co-base rods; Ni-base rods; cast tungsten carbides. (L24, W29h)

822-L.* (French.) **Impregnation of Copper and Copper Alloys With Plastic Materials and Protective Coatings.** Andre Roos. *Cuivre, Laitons, Alliages,* no. 44, July-Aug. 1958, p. 39-47.

Density and mechanical properties of thermoplastic and thermohardening materials; impregnation processes; liquefied plastic coatings, method of application; properties of coatings; applications. 4 ref. (L26p; Cu)

823-L.* (French.) **New Contribution to the Study of the Polishing of Non-geometric Parts.** J. Colange. *Machine Moderne,* v. 52, Aug. 1958, p. 67-69.

Tests of surface roughness of alloy steels and light alloys hand polished with newly developed wheels made of a mixture of rubber and abrasive. Wheels permit surface finishing to mirror polish and are especially useful in manufacture and repolishing of metal molds where precision of dimensions is important. (L10b; NM-j, AY, EG-a38)

824-L.* (French.) **Chemical Nickel Plating.** J. L. Fiedler and J. J. Vanroyen. *Revue du Nickel,* v. 24, July-Aug. 1958, p. 53-63.

Brenner, Kanigen and Niphos processes; processes using hydrazine; properties of coatings; principal applications of these processes. 19 ref. (L28; *Ni*)

825-L.* (German.) **Nonferrous Castings. Products and Processes.** Joa-

chim Muller. *Industrie-Anzeiger,* v. 80, Sept. 12, 1958, p. 30-32.

Applications of alloys based on Al, Mg and Ti. Methods of applying a variety of surface finishes to nonferrous castings by a whole range of mechanical, chemical and electrolytic processes. (L-general, 17-57; Al, Mg, Ti, 5)

826-L.* (German.) **Chemical Surface Treatment of Nonferrous Metals.** H. Keller and F. E. Faller. *Metalloberfläche,* v. 12, May, 1958, p. 145-149.

Literature review of chemical reactions in protective coating of Al by anodic and chemical oxidation, chromate coating of Zn and phosphate coating of Al. Properties of coatings. Pores sealed by treatment with dissolved chromic acid and dichromates or application of oils, waxes and lacquers. Coating processes suited for Cu, Ni, Fe, Cd, Zn, Al and Mg. (L14, L19; EG-a39)

827-L.* (German.) **New Degreasing and Protection Methods for Iron and Steel.** W. Rausch. *Metalloberfläche,* v. 12, Oct. 1958, p. 289-295.

Acid alkali phosphate surface cleaners of 4.8 to 5.8 pH produce a protective film against corrosion. Steps in surface cleaning by spraying: preliminary degreasing, degreasing plus protective coating, water rinsing, rinsing with chromic-acid/phosphoric-acid, drying. 5 ref. (L12, L14b; ST)

828-L.* (German.) **Modern Methods of Lining.** W. Fueller. *Werkstoffe und Korrosion,* v. 9, Aug-Sept. 1958, p. 557-559.

Problems of planning and constructing external heated (or cooled) containers with chemical, thermal and mechanical resistant linings; definition of the swelling power of linings. Effect of the swelling power upon the tensions in the coat and the lining under conditions of operation. Possibilities of thin linings in internal heated apparatus with outside heat insulation. (L22)

829-L.* (Russian.) **Formation of Circular Zones on Electrodes in the Electrodeposition of Metals.** V. V. Bondar and Yu. M. Polukarov. *Doklady Akademii Nauk SSSR,* v. 120, no. 3, 1958, p. 552-553.

Zones explained by variations in crystalline structure of the deposit caused by varying current intensity at different distances from the center. Characteristics of zones are influenced by the composition of electrolyte. Different metals and alloys have their special zone patterns. 8 ref. (L17)

830-L.* (Russian.) **Electrodeposited Bright Tin Plate on Sheet Metal.** A. I. Vitkin and T. P. Plotnikova. *Doklady Akademii Nauk SSSR,* v. 120, no. 3, 1958, p. 588-591.

Tinning process in which liquid Sn is used as an anode, a bath of melted 80% $SnCl_2$ + 5% $ZnCl_2$ + 15% KCl or 80% $SnCl_2$ + 5% $ZnCl_2$ + 15% KF or 75% $SnCl_2$ + 5% $ZnCl_2$ + 5% NH_4Cl_5 + 15% KCl or 64% $SnCl_2$ + 4.5% $ZnCl_2$ + 27% KCl + 4.5% $AlCl_3$ as an electrolyte and the infinite sheet metal strip as a cathode. (L17a; ST, *Sn,* 4-53)

831-L. Strip Preheat Ends Galvanizing Pot Downtime. Edward J. Udick and Charles A. Turner, Jr. *Iron and Steel Engineer,* v. 35, Aug. 1958, p. 145-149.

Preheat furnace has improved quality of soft, continuous-coated galvanized steel sheet and reduced equipment maintenance costs. Furnace with duct containing protective gas eliminates strip fluxing and maintains required bath temperature without external pot firing, which results in low Al addition requirements, negligible dross formation and improved coating adherence. (L16; 4-53, ST, *Zn*)

832-L. Wear and Tear of Enamelled Surfaces. J. W. G. Pedder. *Metal Finishing Journal,* v. 4, July 1958, p. 259-268.

Titania-based enamels are more abrasion resistant than other enamels, and underfiring increased their resistance. Experiments varying the incident of the shot and thickness of the cover coat of titania-based sheet iron enamel. Abrasion of the stove-enameled surfaces caused the film to disintegrate in flakes, similar to crazing in vitreous enamels; whereas, on the vitreous enameled surfaces, the relatively thinner tops of the bubbles were broken and the remaining structure then bore the force of abrasion with much more resistance. (L27, Q9n)

833-L. A Review of Zirconium Bath Enamels. W. A. Ross. *Metal Finishing Journal,* v. 4, July 1958, p. 269-275, 280.

Enamels which are opacified by Zr compounds crystallizing out of the melt during firing. Factors

which control the degree of opacity or reflectance and the size of the crystals. Tests made of constituents which have an effect on solubility of the zirconium oxide in enamels, including fluorine, the most important element. Operational information and composition of three typical baths. Properties of Zr and Sb enamels compared. 12 ref. (L27; Zr, Sb)

834-L. **Developments in Steel Shot and Its Applications to Vitreous Enameling.** D. W. S. Hurst and J. Bradshaw. *Metal Finishing Journal*, v. 4, July 1958, p. 276-280.

New metallic abrasives are genuine steel. Formerly, abrasives have always been manufactured from chilled cast iron. Shot-blasting machinery, typical of those used in the vitreous-enameling industry, must be changed when using this new abrasive. Steel shot increased the number of successfully enameled castings 8%. (L10c, L27, W2a, ST)

835-L.* (Japanese.) **Study of Dispersion Coating of Polytrifluorochloroethylene.** Kazuo Kato and Hideo Nagasaka. *Metal Finishing Society of Japan, Journal*, v. 9, July 1958, p. 252-256.

Considers change of shape of fused particle during baking. Mechanism of film formation and adhesiveness of film for dispersion coating of polytrifluorochloroethylene on metals. Strongly adhesive coatings obtained on Al and steel pretreated by grit blasting. Adhesiveness was low on Cu alloys unless they had been plated with Cr or Ni. (L26p; Al-b, ST)

836-L.* (Japanese.) **Relation Between Surface Potential of Metals and Adhesive Property of Organic Coatings. Pt. 2. Effect of the Phosphoric Acid Treatment of Aluminum on Its Surface Potential and Adhesion of Organic Coatings.** Bunnosuke Yamaguchi and Hirohiko Hattori. *Metal Finishing Society of Japan, Journal*, v. 9, July 1958, p. 257-260.

Surface potential of Al decreased and adhesion of organic coatings increased when the metal surface was treated with a mixture of phosphoric acid and ethyl alcohol. (L26p, L14b; Al-b)

837-L.* (Japanese.) **Diffusion-Anneal of Aluminum-Sprayed Iron and Steel.** Takashi Yamaguchi, Hideo Nagasaka and Takeshi Takei. *Metal Finishing Society of Japan, Journal*, v. 9, July 1958, p. 260-266.

Metallographic investigation of effect of various factors on the formation, structure and state of the diffusion layer obtained by heating Al sprayed on iron and steel. Structure and state of diffusion layer were essentially dependent on time and temperature of annealing and thickness of sprayed layer. Porosity and poor adhesion of the sprayed layers affected unformity of the diffusion layer. Effect of a sealer was advantageous when the sprayed Al layer was less than 0.2 mm. thick. 10 ref. (L23, J23, N1h; *Al*, Fe, ST, 9-68)

838-L. **Titanium Gets Glass Coat.** *American Machinist*, v. 102, Aug. 25, 1958, p. 88.

Ti sheets are protected from contamination by a water-soluble glass coating that is sprayed on before the sheets go into the heat treating furnace. (L26c, Ti, NM-f42)

839-L. **Di-Phase Cleaning and Electrostatic Spraying for the Protection of Slotted Angle.** *Corrosion Prevention & Control*, v. 5, Oct. 1958, p. 61-62.

(L10h, L26n)

840-L. **Deburring With Walnut Shells.** Dean Rockwell. *Die Casting Engineer*, v. 2, Sept. 1958, p. 11.

Shells have high abrasive quality, removing burrs and flashings well, but without peening or distorting surface of part. (L10c; NM-b, NM-j, 5-61)

841-L. **Finishing Kleenacage Bird Cages.** M. C. Dowdall. *Electroplating and Metal Finishing*, v. 11, Oct. 1958, p. 347-350.

Automation in electroplating. (L17, T10, 18-74)

842-L. **Protection Against Corrosion. Survey of Available Materials.** *Food Manufacture*, v. 33, Oct. 1, 1958, p. 411-415.

Rubber-based paints, protective finishes, epoxy resin paints, plastic linings. (L26, R-general)

843-L. **New Method for Etching Copper.** O. D. Black and L. H. Cutler. *Industrial and Engineering Chemistry*, v. 50, Oct. 1958, p. 1539-1540.

Cupric ion-acid process offers advantages over ferric chloride in the etching bath. (L13q; Cu)

844-L. Coatings Boost Metals Into High Heat Ranges. John V. Long. *Industrial Laboratories*, v. 9, Sept. 1958, p. 137-144.

Ceramics provide a degree of resistance to acids and bases, inhibit oxidation and intergranular corrosion, increase fatigue life, prevent carburization, resist attack by molten Zn and Al, modify surface emissivity or reflectivity, and maintain base material strength for longer periods in high-temperature environments. (L27; SGA-h)

845-L. Mechanized Valve Surfacing With the Oxy-Acetylene Flame. J. F. Barnes. *Industry & Welding*, v. 31, Oct. 1958, p. 81-82, 88.

Porosity, cracking and rough surfaces were eliminated.

SECTION M

METALLOGRAPHY, CONSTITUTION and PRIMARY STRUCTURES

1-M. Hydrogen-Uranium Phase Diagrams. M. W. Mallett and M. J. Trzeciak. *First Nuclear and Engineering Science Congress*, v. 1, 1957, p. 168-169.

Recent solubility data were used to prepare diagrams based on terminal solubilities and solubilities at 1 atm. hydrogen pressure. (M24b, U, H)

2-M. Investigation of Nitride Precipitates in Pure Iron and Mild Steels. G. R. Booker, J. Norbury and A. L. Sutton. *Iron and Steel Institute, Journal*, v. 187, Nov. 1957, p. 205-215.

Iron nitride precipitates present in openhearth steel slabs, in a range of nitrided steels, and in nitrided pure iron have been isolated by an extraction replica method, and have been examined by electron microscopy, electron diffraction and X-ray diffraction. Two types of precipitate have been observed and their platelike nature demonstrated. 20 ref. (M26r; Fe-a, CN)

3-M. Metallographic Examination of Glassed Titanium Specimens. M. L. Picklesimer. *U. S. Atomic Energy Commission*, CF-56-5-141, May 18, 1956, 7 p. (CMA)

The firing temperature was within the temperature range of the alpha + beta field of the metal, causing the formation of beta-phase on cooling to room temperature or decomposition to an alloy-rich alpha-phase. Some reaction between the glass and the metal surface probably occurred, but apparently was not serious or detrimental. (M27, N6p; Ti)

4-M. (English.) **Investigation on the Titanium-Iron-Carbon System.** Yotaro Murakami, Hirozo Kimura and Yoshio Nishimura. *Kyoto University, Faculty of Engineering, Memoirs*, v. 19, July 1957, p. 302-319. (CMA)

Solid solubility ranges of TiFe and $TiFe_2$ in the Ti-Fe system are 52-54% Fe at 1080° C. and 69-77% Fe at 1200° C. In the Ti-Fe-C system there occur α-Ti, β-Ti, graphite, δ-phase, TiFe, $TiFe_2$, α-Fe and δ-Fe. Crystal structure, lattice parameters and liquidus surface. 13 ref. (M24c; Ti, Fe, C)

5-M. (Russian.) **Phase Transformations in the System Iron-Chromium-Vanadium.** I. I. Kornilov and N. M. Matveeva. *Zhural Neorganicheskoi Khimii*, v. 2, Feb. 1957, p. 355-366. (CMA)

High-temperature quenched alloys, which are ternary ferrite-containing solid solutions, transform on annealing into brittle, nonferromagnetic alloys containing sigma phase. The temperature of the alpha-sigma transformation rises continuously from 868° C. (FeCr) to 1225° C. (FeV). This points to the existence of a continuous series of solid solutions involving the two compounds. 9 ref. (M24c; Fe, Cr, V)

6-M. (Russian.) **Study of Alloys of the System Iron-Chromium-Nickel-Tungsten-Titanium-Aluminum.** V. S. Mikheev. *Zhural Neorganicheskoi Khimii*, v. 1, Sept. 1957, p. 2110-2117. (CMA)

The six-component diagram was examined in cross sections passing through the point 1.5% Ti and various points between the limits 20-50% Ni and 1.5-8% Al. Effect of changes in Ni and Al content on properties of these alloys, mainly in the region of austenitic solid solutions. 14 ref. (M24d; Fe, Cr, Ni, W, Ti; Al)

7-M. (German.) **Surface of Zinc After Various Treatments.** K. Huber and D.

Laske. *Metalloberfläche,* v. 11, July 1957, p. 217-225.

Coatings on Zn as formed in air, water or solutions examined with electron microscopic and diffractographic methods. Both reflected and penetrating beams are utilized after proper preparation of specimens. The coatings are found to be zinc oxides with variable structures depending on the treatment and on whether the specimen was prepared from the inside or outside of the coating. 5 ref. (M26r, R1h; Zn)

8-M. (German.) **Examination of Surface by Electron Emission Microscopy.** E. B. Bas. *Planseeberichte für Pulvermetallurgie,* v. 5, Aug. 1957, p. 42-52.

Principle of the emission microscope, the obtainable resolution and interpretation of photographs; preparation of specimens; molybdenum carbide used as example for the various applications of the instrument. (M21e, 1-53)

9-M. (Japanese.) **Microscopic Study of Etched Germanium Surfaces. Pt. 2.** M. Kikuchi and S. Iizima. *Electrochemical Laboratory, Bulletin (Denki Shikenjo Iho),* v. 21, July 1957, p. 481-482, + plates.

Etch pits produced by various etchants; discussion of dislocations, small angle grain boundary. (M20q, M21c; Ge, 14-61)

10-M. (Polish.) **Brittleness of Transformer Steel Plate.** F. Khol. *Hutnik,* v. 24, July-Aug. 1957, p. 295-299.

Investigation of plate structure using electron microscope; characteristics of inclusion formation on the grain border causing brittleness. (M27f, Q26s; SGA-r, AY)

11-M. (Russian.) **Electron-Microscope Investigation of the Structure of IKh18N9 Steel After Various Heat Treatments.** E. I. Kvashnina. *Metallovedenie i Obrabotka Metallov,* no. 5, May 1957, p. 35-38.

Structure changes connected with mechanical properties resulting from various heat treatments. (M27, 2-64, Q general; AY)

12-M.* Metallography of Powder-Powered Fastenings in Mild Steel. C. J. Osborn and N. E. Ryan. *Australian Institute of Metals, Journal,* v. 2, Aug. 1957, p. 48-53.

Metallographic study of microstructures occurring at interface between mild steel plate and carbon steel fasteners driven into place by explosive charge. 7 ref. (M27f; CN, 7-53)

13-M.* Study of the Deformed Layer Produced on Metal Surfaces by Mechanical Machining, Abrasion and Polishing Operations. L. E. Samuels. *Electroplating and Metal Finishing,* v. 10, Sept. 1957, p. 279-282, 285.

Metallographic structures and depth of deformed surface layers produced in specimens of 70:30 brass, austenitic steel and Zn by various metallographic machining, abrasion and polishing treatments. Methods of producing strain-free surfaces by electrolytic or mechanical polishing. (To be concluded.) (M27, M20p, K17)

14-M.* Some Metallographic Observations on the Fatigue Behaviour of Copper and Nickel and Certain of Their Alloys. C. A. Stubbington and P. J. E. Forsyth. *Institute of Metals, Journal,* v. 86, Oct. 1957, p. 90-94.

Formation of local soft spots in specimens subjected to cyclic stress. Extension phenomenon has been observed in electrolytic Cu fatigued in the annealed condition at room temperature and in stable solid solutions and pure metals cold worked before cyclic stress. Monel fatigued in the annealed condition at 300° C. reveals a difference in etching characteristics between regions exhibiting slip-band extrusion and the matrix. 6 ref. (M27, M26s, Q7; Cu, Ni)

15-M.* Aluminium-Rich Alloys of the Quaternary System Aluminium-Iron-Copper-Nickel. G. V. Raynor and B. J. Ward. *Institute of Metals, Journal,* v. 86, Nov. 1957, p. 135-144.

The constitution of the Al-rich alloys of the quaternary Al-Fe, Cu, Ni system in the solid state at 530° C. examined by metallographic, X-ray diffraction and electrode-potential measurements. Results in relation to the more recent suggestions with regard to the general nature of Al-rich intermetallic compounds formed by Al and transition metals of the first long period of the periodic table. 20 ref. (M24d; Al, *Fe, Cu, Ni*)

16-M.* Extraction of Minor Phases From Austenitic Steel. J. F. Brown, W. D. Clark and A. Parker. *Metallurgia,* v. 56, Nov. 1957, p. 215-223.

Electrolytic solution has been used as a means of concentrating minor

phases in complex alloys. Results on a variety of austenitic steels extracted with six electrolytes. A series of 18-8-Ti and 18-8-Cb steels was examined to find the effect of heating at 500-900° C. for up to 500 hr. on the phases present. Chromium carbide is found in all these steels but with longer times of heating is replaced by sigma. 13 ref. (M20q, 2-62; SS; *Ti, Cb*)

17-M. Electron Microscopy of Tin Whiskers Using Carbon Replicas. D. E. Bradley, J. Franks and P. E. Rush. *Physical Society Proceedings,* Section B, v. 70, Sept. 1, 1957, p. 889-892.

Study of shape and surface structure revealed cylindrical whiskers, coarsely ridged types, ribbon formations and numerous more complex shapes. No straightforward hexagonal or cubic rods were found. 5 ref. (M21e; Sn, 14-61)

18-M.* Crystal Structure Changes in the Tau Phase of Aluminum-Copper-Nickel Alloys. S. S. Lu and T. Chang. *Scientica Sinica,* v. 6, June 1957, p. 431-462.

X-ray investigation of ternary phase tau. Systematic structure changes are found in single phase field of tau, which occupies extensive area in isothermal section of phase diagram at room temperature. There are eight types of structures, all derived from a basic rhombohedron with corners occupied by Al atoms and centers either occupied by the heavy atoms or remaining vacant. Change of structure types follows closely Ni or Cu content for alloys of constant Al content, atomic size factor appearing to be unimportant in formation of these alloys. For alloy phase of defect lattice type, most fundamental factor controlling formation of structures is average number of valency electrons per basic structural unit. Average number of valency electrons remains remarkably constant throughout entire phase field, while electron composition varies with composition. 13 ref. (M26; Al, Cu, Ni)

19-M. Titanium-Germanium System From 0 to 30% Germanium. V. C. Petersen and R. W. Huber. *U. S. Bureau of Mines, Report of Investigations* 5365, Oct. 1957, 20 p. (CMA)

(M24b; Ti, Ge)

20-M.* A New Nickel-Boron Phase Diagram for Brazing-Alloy Development. G. S. Hoppin, III. *Welding Journal,* v. 36, Dec. 1957, p. 528s-530s.

New determination of the phase relationships in the Ni-rich end of the system. A partial phase diagram is presented. The eutectic temperature was found to be 1980° F., or 100° F. lower than the value previously known. A small region of solid solubility of B in Ni was also found. Development and application of Ni-base high-temperature brazing alloys containing B. (M24b; SGA-f, Ni, *B*)

21-M.* (French.) Charging of Iron in Cathodic Hydrogen in Presence of Sodium Sulphide. Simone Besnard, Riccardo Santini and Jean Talbot. *Comptes Rendus,* v. 245, Sept. 9, 1957, p. 965-966.

Micrographic study of electrolytic Fe showed that in addition to appearance of bubbles distributed uniformly over the metal during charging in absence of SNa_2, there also occurs a more or less continuous widening of grain boundaries, which affects mechanical properties of Fe. These effects can be corrected by annealing at 850° C. in pure, dry hydrogen, as a result of which grain boundaries regain normal appearance but bubbles remain. Boundary phenomenon is probably due to introduction of sulphur into metal during charging. 3 ref. (M27f, C23p; Fe)

52-M.* Some Effects of Heterogeneous Structures in Lead Pipes. J. M. Butler. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 161-163.

Experiments indicate that lead pipes with hetergeneous (zoned)

grain structures have a lower resistance to fatigue than either uniformly fine or uniformly coarse-grained pipes. A method is suggested for preventing the formation of heterogeneous structures by controlled deformation and recrystallization. The method might also be used to control grain-size independently of extrusion conditions. 6 ref. (M27c, N5; Pb, 4-60)

53-M.* Plutonium-Iron System. P. G. Mardon, H. R. Haines, J. H. Pearce and M. B. Waldron. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 166-171.

Equilibrium diagram for Pu-Fe alloys. Results verify existence of the compounds Pu_6Fe and $PuFe_2$; low-melting-point eutectic between delta-Pu and Pu_6Fe; and a high-melting-point eutectic between $PuFe_2$ and gamma-Fe. 11 ref. (M24b; Pu, Fe)

54-M.* Preliminary Investigation of the Plutonium-Thorium System. D. M. Poole, G. K. Williamson and J. A. C. Marples. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 172-176.

X-ray, metallographic, thermal-analysis and dilatometric studies used to investigate the Pu-Th phase diagram. Plutonium dissolves extensively in alpha-Th, the maximum solubility being 48.5 at. % at 615° C. The large solubility of Pu in alpha-Th is possibly associated with a considerable increase in the apparent atomic radius of the Pu atom; this large radius corresponds to a valency of 4 on Zachariasen's scheme, equal to that of Th; this, it is suggested, accounts for the wide stability range of the solution. 4 ref. (M24b; Pu, Th)

55-M.* Aluminium-Rich Intermetallic-Compound Phases in the System Aluminium-Iron-Cobalt-Copper. G. V. Raynor and B. J. Ward. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 182-184.

Metallographic and X-ray methods, together with the chemical analysis of primary crystals extracted from slowly cooled alloys, show that the phases T(CoCu) and T(FeCu) form a complete series of solid solutions in the quaternary system Al-Fe-Co-Cu. (M24d; Al, Fe, Co, Cu)

56-M.* Lattice Spacings and Melting Points in the Thorium-Cerium System. R. T. Weiner, W. E. Freeth and G. V. Raynor. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 185-188.

The Th-Ce system studied by X-ray and micrographic methods. The system shows complete solid solution over the whole composition range at room temperature. The alloys are face-centered cubic, and an anomalous decrease in the lattice spacing of the Th-rich alloys with increasing Ce content is observed. It is suggested that this anomaly is caused by the transition of an electron normally in a 4f ionic state in Ce to a 5d bonding state. 13 ref. (M26, P12n; Th, Ce)

57-M.* Constitution of Magnesium-Rich Magnesium - Aluminium - Calcium Alloys. J. A. Catterall and R. J. Pleasance. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 189-192.

Isothermal sections at 450, 370 and 290° C. of the Mg-Al-Ca system have been constructed at compositions up to 6 wt. % Al and 1.6 wt. % Ca. The phases appearing in this range are alpha (Mg), Mg_2Ca, Al_2Ca, and $Mg_{17}Al_{12}$. (M24c; Mg, Al, Ca)

63-M.* Interpretation of Roll Textures of Face-Centered Cubic Metals. E. R. W. Jones and E. A. Fell. *Acta Metallurgica,* v. 5, Dec. 1957, p. 689-671.

Evidence from two different approaches is shown from which it is concluded that a mixture (110) [112] and (112) [111] textures describes the roll texture of f.c.c. metals better than (123) [412]. 7 ref. (M26c)

64-M.* Additional Modes of Deformation Twinning in Magnesium. R. E. Reed-Hill and W. D. Robertson. *Acta Metallurgica,* v. 5, Dec. 1957, p. 717-727.

Evidence is presented for the existence of two additional modes of deformation twinning, (3034) and (1013), produced by tensile stress parallel to the basal plane in Mg single crystals. The crystallographic mechanism of formation of (3034) twins is discussed in detail because fracture occurs by a parting mechanism in this twin. The temperature dependence of both modes of twinning, in the range of −190-286° C., is unusual in that they are formed most readily at higher temperatures. 14 ref.
(M26c, Q24b, 2-60; Mg, 14-61)

65-M.* Density of Dislocations in Compressed Copper. L. M. Clarebrough, M. E. Hargreaves and G. W. West. *Acta Metallurgica,* v. 5, Dec. 1957, p. 738-740.

Changes in energy, macroscopic density and electrical resistivity associated with the annealing of deformed Cu have been measured. Three independent estimates of the density of dislocations in the deformed material are obtained by combining these results with the best available theoretical values for the energy, density and resistivity changes associated with dislocations. 11 ref.

68-M. Lattice Constants of Separated Lithium Isotopes. E. J. Covington and D. J. Montgomery. *Journal of Chemical Physics,* v. 27, Nov. 1957, p. 1030-1032.

6 ref. (M26, 14-63; Li)

69-M.* Investigation of the Nickel-Rich Portion of the System Ni-Zr. Emma Smith and R. W. Guard. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1189-1190. (CMA)

Alloys containing up to 60 at. % Zr were made in a study of the Ni-rich end of the Ni-Zr system. Procedures are described. The solid solubility of Zr in Ni is less than 1 at. %, and microstructures are essentially single phase. Compounds have been identified tentatively as Ni_5Zr, Ni_7Zr_2, Ni_5Zr_2, Ni_5Zr_4 and NiZr. Ni_5Zr is face-centered cubic with $a = 6.71$ Å, and is isomorphous with Ni_5U and Cu_5U. Other structures appear complex. 4 ref.
(M24b; Ni, Zr)

70-M.* Cross-Rolling and Annealing Textures in High-Purity Iron. Hsun Hu. *Journal of Metals,* v. 9, *AIME Transactions,* v. 209, Oct. 1957, p. 1164-1168.

X-ray Geiger counter spectrometer used for determination of texture following deformation and annealing of cross-rolled high-purity iron. Deformation texture predominantly (100), [011] plus minor texture components of (111), [110] or (111) or [112] in partially recrys-

tallized specimen; minor deformation texture components were replaced by new orientation while major deformation texture was retained. Texture developed after complete recrystallization could be described as rotations around each of the (110) poles of minor textured components. 12 ref.
(M26c, N5; Fe-a)

71-M.* Preparation and Diffraction Data of Ba-Al Alloys. Dilip K. Das and Douglas T. Pitman. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1175.

Arrangement for preparation of $BaAl_4$ and X-ray diffraction data for powdered $BaAl_4$.

73-M. (German.) **Systems Zirconium-Sulphur and Structure of Some Compounds.** Harry Hahn, Berhnard Harder, Ursula Mutschke and Peter Ness. *Zeitschrift für Anorganische und Allgemeine Chemie*, v. 292, Nov. 1957, p. 82-96.

X-ray examination established existence, in addition to already known compounds ZrS_3 and ZrS_2, of compounds ZrS and Zr_4S_3 and of phases Zr_3S_4. 13 ref.
(M24b, M26r, Zr, *S*)

74-M.* Investigation of Grain Boundary Phase in Stainless Steel. C. C. Clark, J. R. Mihalisin and K. G. Carroll. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1210-1211.

Electron micrographs, electron diffraction data in chemical analysis used for exploring grain-boundary precipitate thought to be responsible for anomalous behavior of particular heat of Type 310 stainless steel. Possible relationship of precipitate to iron boro-carbide and chromium carbide. (M27f; SS)

75-M.* The Uranium-Silicon Epsilon Phase. S. Isserow. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1236-1239.

Investigation of composition, corrosion resistance, physical and mechanical properties and extrusion constant of epsilon alloy of U- Si. Corrosion resistance depended upon absence of phases other than epsilon. Epsilon phase has Si content in the range of 3.9 to 4%. 5 ref.
(M26q, R general; U, *Si*)

76-M.* CsCl-Type Ordered Structures in Binary Alloys or Transition Elements. T. V. Philip and Paul A. Beck. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1269-1271. (CMA)

Among the binary alloys studied for CsCl-type structures were V-Fe, Ti-Fe, Ti-Co, Ti-Ni and Ti-Re. The Ti-Re alloys are found to have a body-centered cubic structure. Bond strengths decrease when V is substituted for Ti, which has a strong tendency to form CsCl-type structures. The bond strength increases from TiNi to TiCo to TiFe. 8 ref.
(M26; 2-60; Ti)

77-M. Cylindrical Carbide Particles. J. H. Westbrook. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1277.

Notes on the structure of cylindrical carbide particles formed in chromium carbide alloys containing 3.2% C. Phases present alloy identified as alpha Cr and $Cr_{23}C_6$.
(M27, 14-68; ST)

78-M. Distribution of Boron in Gamma Iron Grains. R. M. Goldhoff and J. W. Spretnak. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1278-1283.

Distribution of B in gamma Fe grain as a function of temperature by means of three experimental techniques including grain growth in high-purity FeC and FeC-B alloys. X-ray diffraction measurements of lattice parameters of FeB alloys as function of temperature and metallographic tests for B in grain boundaries. Boron undergoes adsorption to gamma Fe grain boundaries and temperature coefficient of adsorption is positive. 27 ref.
(M25m; Fe, B)

79-M. Crystallographic Angles for Manganese Bismuthide. W. J. Romanow. *Journal of Metals*, v. 9, *AIME Transactions*, v. 209, Oct. 1957, p. 1284.

Note giving table of angles between crystallographic plane of man-

ganese bismuthide. 7 ref.
(M26q; Mn, Bi)

80-M. Recent European Advances in Optical Metallography. Roland Mitsche. *Metal Progress,* v. 73, Jan. 1958, p. 97-101.

Modern microscopes are designed to avoid fatigue of the operator, with automatic timing, continuous focusing and multiple light sources. Attachments exist for hardness tests and visual observations, in vacuum or controlled atmospheres, at temperatures from −325 to +2700° F.

(M21f)

89-M.* Observation of Dislocations in Silicon. W. C. Dash. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 57-68.

A technique has been developed to decorate dislocations in Si so they are visually observable with an infrared image tube in conjunction with a microscope. Silicon single crystals were grown by drawing from the melt contained in a quartz crucible. These were then etched during a period of several hours or overnight in a mixture of nitric, hydrofluoric, and acetic acids to produce deep pits at the points of emergence of the dislocations.
(M26b, M20q; Si)

90-M.* Direct Observations of the Arrangement and Motion of Dislocations in Aluminum. P. B. Hirsch, R. W. Horne and M. J. Whelan. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 92-115.

It has been possible to observe directly dislocations in Al by transmission electron microscopy using a high resolution electron microscope. Most of the specimens examined so far were prepared by heating 99.99 + % Al and 99.8% Al at room temperature, followed by etching in dilute HF. 13 ref.
(M26b, M21e; Al)

91-M.* Thermal Etching of Dislocations in Silver. E. S. Machlin. Paper from "Dislocations and Mechan-

ical Properties of Crystals". John Wiley & Sons, Inc., p. 164-171.

Dislocations in Ag may be revealed by a thermal etch technique. It is believed pits are formed at the points of emergence of dislocations as a result of the equilibration of the dislocation line tension and the surface tension. In this technique, electropolished Ag is immersed in a dynamic flow of A containing 10 mole % of oxygen at 600° C. for 5 to 10 min. and then cooled to room temperature in purified A. (M26b, M20q; Ag)

92-M.* Thermal Etching of Dislocations. Hideji Suzuki. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 172-175.

Thermal etching technique can be applied to most metals and alloys, except for some metals having high vapor pressure at high temperature, such as Zn, Cd, Mg and their alloys. Some examples of Fe-Ni alloys which were oxidized at 1100° C. for 30 min. are shown. (M26b, M20q)

93-M.* Mechanism of Glide and Work Hardening in Face-Centered Cubic and Hexagonal Close-Packed Metals. Alfred Seeger. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 243-329.

A theoretical picture is given for the dislocation processes governing the plastic properties of face-centered cubic metals and alloys and of hexagonal metals with basal glide. It is based on the similarities and dissimilarities of the dislocations in face-centered cubic and hexagonal close-packed structures and in metals and alloys with low and high stacking fault energies. It accounts for the critical shear stress of pure metals and dilute alloys, work hardening, recovery, surface markings (slip bands) and creep. 146 ref. (M26b, Q24)

94-M.* Lattice Defects in Plastically Deformed Metals. W. Boas. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 333-344.

In all metals investigated, irrespective of the heating rate and of whether deformation occurs by tension, compression or torsion, there is a rapid evolution of energy at the high-temperature end of the curve showing the release of energy. This energy release is always associated with recrystallization, as has been proved by metallographic and X-ray methods. It is accompanied by changes in hardness, density and electrical resistivity. This energy is derived from the disappearance of the dislocations created by deformation. 19 ref. (M26s, M26b, N5)

95-M.* Nature and Effect of Substructure in Polycrystalline Aluminum. C. J. Ball. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 353-358.

Subgrain size decreases with increasing deformation and approaches a limiting value which increases linearly with the temperature of deformation. The types of stress-free low-angle boundary that can be formed without climb with dislocations of one, two, or three systems have been calculated. If dislocations of only one or two systems are present, the possible rotation axes are [100], [111], and in the plane (110). (M26b, M27c; Al)

96-M.* A Comparison of Preyield Microstrain in Steel With Dislocation Theory. D. S. Wood. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 413-418.

If a stress is suddenly applied to the material and maintained constant thereafter, the initial rate of plastic straining should be proportional to the rate of release of dislocations from atmospheres. Experimental record of tensile load and preyield inelastic microstrain versus time under conditions of rapidly applied constant load. Experimental curves of microstrain versus time for several values of applied tensile stress at room temperature. For stress less than the upper yield stress (about 40,000 psi.) the microstrain asymptotically approaches some equilibrium value. (M26b, Q24h; ST)

97-M.* Theory of Whisker Dekinking. F. R. N. Nabarro. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 521-536.

Several different mechanisms for the straightening on annealing of a single crystal whisker which has been plastically kinked. Analysis shows that the only mechanism of straightening which will explain the high and roughly uniform rate of the process is that of dislocation climb by migration of vacancies or interstitial ions. The rate of evolution of vacant lattice sites from jogs in dislocations is only sufficient

to maintain this rate of climb if the edges of the dislocations are densely packed with jogs. Dislocation glide may account for the rapid initial recovery. 11 ref. (M26b, 14-61)

98-M.* Thermal Annealing of Imperfections in the Noble Metals. J. S. Koehler, J. W. Henerson and J. H. Bredt. Paper from "Dislocations and Mechanical Properties of Crystals". John Wiley & Sons, Inc., p. 587-602.

The annealing of irradiated, quenched, cold worked, and evaporated noble metals is examined. Six stages of annealing are described; the associated activation energies range from 0.1 to about 2.1 ev. An attempt is made to assign each stage of annealing to a particular atomic process. The magnitude of the resistance introduced by dislocations is considered. 36 ref. (M26s, M26b, J23, P13a; EG-c)

99-M.* (Czech.) **Plastic Deformation of Steel During Repeated Heating-Cooling Cycles and Microstructures of Metals and Alloys at High Temperatures.** M. G. Lozinskij. *Hutnické Listy,* v. 12, Nov. 1957, p. 974-985.

Selective color oxidation permits observation of differences in orientation of individual grains and peculiarities of differences in microstructure in vacuum heating. IMAS-5M apparatus developed in the U.S.S.R. permits direct microscopic observation and photography of the deformation of the heated specimens. 21 ref. (M27, 2-62, X4, X5; ST)

100-M.* (German.) **Electron Microscope Studies of the Substructure of Chemically Brightened Aluminum Surfaces.** D. Altenpohl and W. Hugi. *Aluminium,* v. 33, Dec. 1957, p. 774-781.

Grains of chemically brightened Al surfaces contain more than 1000 subgrains, mostly 0.2-4 microns. Electron micrographs made on high-purity Al showed the cast and heat treated structures, the cold rolled substructure, structures in the stress-relieved state and substructure after recrystallization. Correlation exists between the substructures and the position of the plane of observation in the crystal lattice, the purity of the Al, the cold reduction and the type of heat treatment. 11 ref. (M27, M21e; Al)

101-M. (German.) **Investigations on the Phase Diagram of Iron (II) Oxide and Managanese (II) Oxide and Its Relation to the Deoxidation of Pure Iron With Managanese.** Herman Schenck, Norbert G. Schmahl and A. K. Biswas. *Archiv für das Eisenhüttenwesen,* v. 28, Sept. 1957, p. 517-521.

The phase diagram of the system iron (II) oxide and manganese (II) oxide was determined by observing the melting of small cylinders in a special furnace heated by a molybdenum spiral. The liquidus and solidus curves are described with thermodynamic calculations. The latent heat of fusion was determined for both substances, and the melting point of Mn (II) oxide was found to be 1750° C. The deoxidation diagram of pure iron with Mn was determined. 25 ref. (M24c, P12, D11r; Fe, *Mn, O*)

102-M. (German.) **Electron Microscope Examination of Buffed and Ball Burnished Metal Surfaces.** M. Dreher. *Metallwaren-Industrie und Galvanotechnik,* v. 48, July, 1957, p. 284-288.

Advantages of both methods, with special attention to the development of electron microscopy. (M21e, L10b, S15d)

Images obtained in working with an electron projector with a tungsten point under conditions of relatively "poor" vacuum with continuous evacuation of tube by oil diffusion pumps. 13 ref. (M21e, 1-53)

109-M.* **Some Effects of Heterogeneous Structures in Lead Pipes.** J. M. Butler. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 161-163.

Experiments indicate that lead pipes with heterogeneous (zoned) grain structures have a lower resistance to fatigue than either uniformly fine or uniformly coarse-grained pipes. Method for preventing the formation of heterogeneous structures by controlled deformation and recrystallization. The method might also be used to control grain size independently of extrusion conditions. 6 ref. (M27c, N5, F24; Pb, 4-60)

110-M.* **Plutonium-Iron System.** P. G. Mardon, H. R. Haines, J. H. Pearce and M. B. Waldron. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 166-171.

Equilibrium diagram for Pu-Fe alloys. Results verify the existence of the compounds Pu_6Fe and $PuFe_2$, a low-melting-point eutectic between delta Pu and Pu_6Fe, and a high-melting-point eutectic between $PuFe_2$ and gamma iron. 11 ref. (M24b; Pu, Fe)

111-M.* **Preliminary Investigation of the Plutonium-Thorium System.** D. M. Poole, G. K. Williamson and J. A. C. Marples. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 172-176.

X-ray, metallographic, thermal-analysis and dilatometric studies. Pu dissolves extensively in alpha Th, the maximum solubility being 48.5 at. % at 615° C. The large solubility of Pu in alpha Th is possibly associated with a considerable increase in the apparent atomic radius of the Pu atom; this large radius corresponds to a valency of 4 on Zachariasen's scheme, equal to that of Th. 4 ref. (M24b; Pu, Th)

112-M.* **Aluminum-Rich Intermetallic-Compound Phases in the System Aluminium-Iron-Cobalt-Copper.** G. V. Raynor. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 182-184.

Metallographic and X-ray methods and chemical analysis of primary crystals extracted from slowly cooled alloys show that the phases T(CoCu) and T(FeCu) form a complete series of solid solutions in the quaternary system Al-Fe-Co-Cu. (M24d; Al, Fe, Co, Cu)

113-M.* **Lattice Spacings and Melting Points in the Thorium-Cerium System.** R. T. Weiner, W. E. Freeth and G. V. Raynor. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 185-188.

Thorium-cerium system studied by X-ray and micrographic methods shows complete solid solution over the whole composition range at room temperature. The alloys are face-centered cubic, and an anomalous decrease in the lattice spacing of the Th-rich alloys with increasing Ce content is observed. The solidus curve is determined up to 1550° C. A high-temperature vacuum furnace and a gravity-quenching technique were used above 1200° C. 13 ref. (M26, P12n, M24b; Th, Ce)

114-M.* **Constitution of Magnesium-Rich Magnesium-Aluminium-Calcium Alloys.** J. A. Catterall and R. J. Pleasance. *Institute of Metals, Journal,* v. 86, Dec. 1957, p. 189-192.

Isothermal sections at 450, 370 and 290° C. of the Mg-Al-Ca system have been constructed at compositions up to 6% Al and 1.6% Ca. The phases appearing in this range are alpha (Mg), Mg_2Ca, Al_2Ca, and $Mg_{17}Al_{12}$. (M24c; Mg, Al, Ca)

115-M.* **Studies on Group III-V Intermetallic Compounds.** C. Kolm, S. A. Kulin and B. L. Averbach. *Physical Review,* v. 108, Nov. 15, 1957, p. 965-971.

Properties of the compounds GaAs and InSb alloyed with Si, Ge, Sn and Pb; the quasi-binary InSb-GaSb also investigated. Lattice parameter, infrared absorption and electrical re-

sistivity measurements were made. The forbidden energy gaps of the GaAs alloys were found to vary inversely with the spacing, with the one exception of the GaAs-Ge alloy, where the reverse effect was observed. On the basis of the infrared transmission and electrical resistivity data it was concluded that the Group IV elements substituted for nearest-neighbor pairs in GaAs, but in the case of Si and Ge in InSb it appeared that the substitution of only one atom in the unit polyhedron occurred. 13 ref.
(M26q, P15g; Ga, As, In, Sb)

116-M.* Study of Freshly Deformed Metal Surfaces With the Aid of Exo-Electron Emission. L. Grunberg. *Wear,* v. 1, Oct. 1957, p. 142-154.

Review of literature dealing with emission of exo-electrons from deformed metal surfaces. Recent investigations show that surface films on deformed metals contain special electron energy levels associated with crystal imperfections in the oxide lattice. The energy levels can be excited thermally or optically leading to electron emission at definite temperatures or wave lengths of light. 19 ref.

157-M. Observation of Vacancy Sources in Metals. R. S. Barnes, G. B. Redding and A. H. Cottrell. *Philosophical Magazine,* v. 3, Jan. 1958, p. 97-99.

Grain boundaries are effective sources of vacancies, but twin boundaries are not. (M26s, M27f; Cu)

158-M.* **New Data Concerning Uranium Alloys.** *Soviet Journal of Atomic Energy,* v. 2, no. 6, 1957, p. 712-714. (Translated by Consultants Bureau, Inc.)

The U-Bi system studied metallographically and by X-ray diffraction, neutron diffraction and thermal analysis. Alloys containing up to 30% U were prepared in a graphite crucible at about 1300° C. from pieces of U and Bi (99.99%), the latter having been filtered through a porous Pyrex filter. Alloys with a higher U content were prepared from U powder and crushed Bi, the U powder being obtained by hydrogenation and dehydrogenation in the same graphite crucible in which the alloy was prepared. The system is of practical interest, since Bi is very fusible and has a low thermal neutron cross section, and U-Bi alloys may be used as liquid nuclear fuels. 5 ref. (M24b, 1-60; U, Bi)

184-M.* (Italian.) **Thermodynamic Research on Metal Systems. Note 10. Definition of the Miscibility Gap and Replotting of the Phase Diagram of the Zn-Cd-Bi System.** Mario Fiorani and Luigi Oleari. *Ricerca Scientifica,* v. 27, Dec. 1957, p. 3614-3628.

From emf. measurements taken along four pseudo-binaries with constant Cd and Bi atomic ratios of 6.3/1, 3/1, 1/1 and 1/3 respectively, partial molar thermodynamic quantities for Zn in Zn-Cd-Bi system were obtained. Quantities were used to define miscibility gap at 450, 500 and 550° C., and a graphic procedure was devised to overcome problems arising from position of gap. Partial molar quantities were recalculated for Bi and Cd, thus permitting reconstruction of complete phase diagram. 25 ref.
(M24c; Zn, Cd, Bi)

185-M.* (Russian.) **Influence of Fiber Orientation on Contact Fatigue Resistance of Hardened Steels.** A. S. Shein. *Metallovedenie i Obrabotka Metallov,* Dec. 1957, p. 61-66.

It is possible to discern three kinds of orientation of fibers by macroscopic examination: longitudinal, transverse and facial. Hardened steel with transversely oriented fibers is less tough than that with fibers having facial orientation, but its contact fatigue life is 3 to 5 times longer. (M28, Q7; ST)

Techniques for determining crystal structure and identifying materials using powder X-ray diffraction. Equipment, theory and mathematical analysis of diffraction patterns. (M22g)

200-M. Constitution of the System Indium-Thallium-Lead, With Reference to Structural Transformations. G. V. Raynor and J. Graham. *Faraday Society, Transactions,* v. 54, Pt. 2, Feb. 1958, p. 161-173.

12 ref. (M24c; Pb, In, Tl)

201-M.* Note on Aluminum-Rich Aluminum - Manganese - Copper - Nickel Alloys. G. V. Raynor and C. R. Faulkner. *Institute of Metals, Journal,* v. 86, Mar. 1958, p. 323-324.

Metallographic examination of slowly cooled alloys, and of alloys annealed for long periods at 500° C., indicates that the ternary compounds $Ni_4Mn_{11}Al_{30}$ and $Cu_2Mn_8Al_{20}$ form a complete series of solid solutions in the quarternary system Al-Mn-Cu-Ni. (M24d; Al, Mn, Cu, Ni)

202-M. Comparison of Electron With Neutron Irradiation of Alpha Brass. A. C. Damask. *Physics and Chemistry of Solids,* v. 4, no. 3, 1958, p. 177-181.

Decrease in electrical resistivity of alpha brass which arises from increased short-range order is used as a measure of migration of excess vacancies during neutron and electron irradiation. Theoretical estimates indicate that about 14 times more vacancies are produced by the electron than by the neutron irradiation. 9 ref.
(M26s, 2-67, P15g; Cu-n)

203-M.* (French.) **Use of the Positron for Study of the Electronic Structure of Metals.** E. Daniel. *Journal de Physique et le Radium,* v. 18, Dec. 1957, p. 691-693.

It appears that the disturbance introduced with the positron may be too strong to permit much accuracy in studies of electronic structure, as screening effect obscures other phenomena. However, this technique provides an excellent pattern for study of the screening effect itself, a study which could be extended to analysis of X-ray spectra of solids. Similar problems of Knight effect in alloys are posed in field of nuclear magnetic resonance. (M25, P16f)

204-M. (German.) **Investigation of Metal Structures at High and Low Temperatures.** Rys Premysl, Bezdék Ladislav, Ciha Karel, Ruzicka Dalibor and Skarek Jiri. *Acta Technica,* v. 3, Jan. 1958, p. 58-83.

Principles and importance of high and low-temperature microscopy. Review of foreign apparatus and description of a high-temperature microscope and cooling chamber. Tests on carbon and alloy steels, cast iron and nonferrous metals and alloys. (M21c, 1-53; ST, CI, 2-62, 2-63)

205-M.* (German.) **Etching Process for the Determination of Corroison Resistant Chromium-Nickel and Chromium - Nickel - Molybdenum Steels (Stainless Steels).** Friedrich Karl Naumann and Wolfhard Carius. *Archiv für das Eisenhüttenwesen,* v. 28, Oct. 1957, p. 641-644.

Etching process to discriminate between stainless steels with and without Mo. Utilizes the coloring effects of an etching solution of 100 cc. HCl + 200 cc. H_2O + 30 g. $K_4Fe(CN)_6$. Another indication was $K_3Fe(CN)_6$. The steel without Mo showed many given precipitations indicating a less stable alloy. 12 ref. (M20q; SS, *Mo*)

206-M. (German.) **An Electron Microscope Method for Direct Observation of Fracture Structures.** Wolfgang Pitsch. *Archiv für das Eisenhüttenwesen,* v. 28, Oct. 1957, p. 663-666.

Vaporized carbon was applied under vacuum to fractured surfaces of austenitic and ferritic steel specimens. The carbon layer is then separated electrolytically. This process destroys the structure of the fracture, but the carbon matrix obtained is of high quality and permits close observation of the crystal structure. 9 ref. (M21e; ST)

207-M.* (German.) **Equilibrium Conditions in System Iron (II) Oxide-Zirconium Oxide.** Wilhelm Fisher and A. Hoffmann. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 739-743.

System investigated at temperatures above 1300° C. by thermal analyses, microscopic and X-ray methods and slag equilibria determination. A phase diagram for temperatures betwen 1300 and 1800° C. was designed, showing that iron (II) oxide has no solubility for zirconium oxide, while zirconium oxide absorbs 3% FeO at 1800° C. and 4% FeO at 1450° C. A eutectic composition is found at 1330° C. with 3% ZrO_2. Formation and lattice structure of the crystals. (23 ref.) (M24d; Fe, Zr, 14-68)

208-M. (German.) **Submicroscopic Observations on Thin Iron Films.** Wolfgang Pitsu. *Archiv für das Eisenhüttenwesen,* v. 28, Nov. 1957, p. 745-752.

Extremely thin iron films were sprayed in the form of vapor on a base material under vacuum and then carefully separated. The specimens were observed under an electron microscope with penetrating beams. Some specimens were annealed at 450 to 750° C. It was found that the crystals collect in certain areas, forming crystal clusters. Thin layers along crystal boundaries are believed to be iron oxide. Depending on the thickness of the initial iron vapor film, crystal drops, crystal chains or crystal layers are formed within seconds at 600° C. 29 ref.
(M26n; Fe, 14-62)

209-M.* (German.) **Methods for Observation of Metal Surfaces, From Straight Beam Microscopy to Contrast-Interferometry.** H. Arndt. *Metall,* v. 11, Oct. 1957, p. 864-868.

Normal microscopy requires etching, which gives sufficient resolution of image; frequently, however, it affects the microstructure of the surface. A double prism, put into the beam of a microscope, modulated the complex amplitude of the light reflected from the object. Height differences of less than 20 angstroms can now be observed. Thus electrolytic polishing could be used instead of etching. The results are demonstrated on electrolytic copper and alpha brass (33% Zn). 10 ref. (M21, 1-53)

210-M. (German.) **Electron Microscope Studies on the Fabrication of Gold Foil.** E. Bruche and K. J. Schulze. *Metall,* v. 12, Jan. 1958, p. 21-27.

After the last heating process, gold foil permits flow of electrons, so its structure (a net of rectangles) can be seen with the help of an electron microscope. Defects such as perforations caused by base metals (zinc, iron, etc.) can be observed. 8 ref. (M21e; Au-b, 4-56)

211-M.* (German.) **Investigation of System Aluminum-Zinc Decomposition, Size Change, Hardness Diagram and Resistance to Upsetting.** E. Pelzel. *Metall,* v. 12, Mar. 1958, p. 197-201.

Experiments with Al-Zn alloys containing various amounts of Zn. With Zn content above 79% the concentration of beta crystals and of solid solution changes slightly above 275° C. Annealing at 300° C. produces two-phase structure. Alloy with 61.4% Zn consists, at temperature just below decomposition point, of 62% beta crystals (21% Al) and 38% beta-prime crystals (66% Al). (M24b; Al, Zn)

(M21e, M20r)

213-M.* **X-Ray Study of Faults in Body-Centered Cubic Metals.** O. J. Guentert and B. E. Warren. *Journal of Applied Physics,* v. 29, Jan. 1958, p. 40-48.

Effect on X-ray diffraction pattern of deformation faults and twin faults occurring at random on the (211) planes of a b.c.c. lattice. In single crystal reflections, deformation faults produce peak shifts and peak broadening, and twin faults produce a peak asymmetry and peak broadening. For a powder pattern it is necessary to average over the different components of a powder-pattern peak; the peak shifts average cut to zero, and the peak asymmetries to a quantity which is generally too small to measure. Both types of fault produce a line broadening which varies strongly from one powder peak to another. 14 ref. (M22f, M26s, Q24c)

214-M. **Energy-Band Structure of a Hypothetical Carbon Metal.** Russell C. Casella. *Physical Review,* v. 129, Jan. 1, 1958, p. 54-60.

29 ref. (M26r; C)

215-M. **Distortion of the Lattice Around an Interstitial, a Crowdion, and a Vacancy in Copper.** Ludwig Tewordt. *Physical Review,* v. 109, Jan. 1, 1958, p. 61-68.

A general method for calculating lattice distortions around point defects is proposed. Atoms in a sufficiently large region I around the defect and in a "boundary" region II around region I are treated as discrete particles. A set of proper elastic solutions is joined to the displacements of the atoms in region II. The equilibrium state of the lattice is determined by successive solution of sets of linear algebraic equations. Actual calculations have been done with the help of the Illiac digital computer for an interstitial, a crowdion, and a vacancy in copper. 26 ref. (M26; Cu)

216-M. **Preferred Orientations Predictable in Alpha Uranium.** C. Fizzotti. *United Kingdom Atomic Energy Authority,* 304/MR/157, Jan. 1957, p. 3-13. (Translation from *Energia Nucleare,* v. 3, 1956, p. 102-112.)

Plastic deformation causes, in a polycrystalline aggregate, certain orientations of crystallographic planes and directions, depending on the particular type of deformation imposed. It is then said that the aggregate has assumed a deformation texture. The textures caused by fixed deformations in one phase of uranium, the most interesting phase from the point of view of metallurgy, orthorhombic alpha uranium are forecast. 7 ref. (M26c; U)

217-M. (English.) **On the Application of a Variational Principle to Binary Alloys in the Ising System.** I. A. Kvasnikov. *Soviet Physics, Doklady,* v. 2, no. 2, 1957, p. 158-160. (Translation by American Institute of Physics.)

226-M. (Czech.) **Simple Extraction Replica for the Study of Fine-Grain Phases.** Jaroslav Jezek. *Hutnické Listy,* v. 13, Mar. 1958, p. 213-220.

21 ref. (M21e, M20q, M27c)

227-M. (French.) **Some New Applications of Microfractography.** J. Plateau, G. Henry and C. Crussard. *Publications de l'Institut de Recherces de la Sidérurgie,* Series A, no. 160, June 1957.

Microfractography is the examination of rupture surfaces by the electron microscope. Method permits local observation of the mode of rupture, submicroscopic inclusions and precipitates. Interesting results can be obtained even with relatively inexpensive electron microscopes of not too high a resolving power. (M21e, M23p)

228-M.* (French.) **Appearance and Stability of the Polygonized State in Pure Iron and Aluminum Crystals.** C. de Beaulieu. *Publications de l'Institut de Recherches de la Sidérurgie,* Series A, no. 132, Apr. 1956.

Dislocations of the crystalline lattice may, at a certain temperature, be shifted and reassembled to form new boundaries within the crystal, a phenomenon called polygonization. Polygonization of the pure metal was found to occur after quenching and annealing; it represents a very stable state. Studies on large polygonized single crystals revealed new properties of very pure Fe and Al and the tendency to polygonization as a function of the purity of the metal.
(M26n, M26b; Al-a, Fe-a, 14-61)

229-M.* (German.) **Investigation of Metal Structures at High and Low Temperatures. Pt. 3. High and Low-Temperature Microscopy of Steel.** Premysl Rys, Ladislav Bezdék, Karel Ciha, Dalibor Ruzicka and Jiri Skarek. *Acta Technica,* v. 3, Feb. 1958, p. 85-120.

Development and growth of austenite grains using thermal etching. Photographs of polished surfaces show cementite or ferrite segregation in relief data on martensite formation. Preliminary experiments with thermal etching on cast iron and some nonferrous metals.
(M20q, 1-66, M27c, N8f; ST)

230-M.* (German.) **Disintegration of Wustite With Metallic Iron Present After Quenching to Temperatures Below 570° C.** Wilhelm Anton Fischer and Alfred Hoffmann. *Archiv für das Eisenhüttenwesen,* v. 29, Feb. 1958, p. 107-113.

Wustite specimens, containing primary iron, were melted in quartz tubes under 10^{-5} Torr pressure, then annealed at 1100 or 640° C. and then quenched to temperatures between 145 and 550° C., and held there for 30 days. The lattice constant depends on the temperature and was 4.326 Angstroms between 180 and 350° C. and 4.299 to 4.300 Angstroms at 550° C. (M26, 2-64; Fe)

231-M. (German.) **Counting Tube Method With Newly Developed Specimen Retainer for the Represntation of Textures.** Johanna Grewen, Armin Segmuller and Gunter Wassermann. *Archiv für das Eisenhüttenwesen,* v. 29, Feb. 1958, p. 115-118.

New specimen retainer which is adaptable both for the direct beam and reflection methods. Quantitative pole figures were obtained through given mathematical formulas, eliminating the necessity of calibration specimens. 14 ref.
(M23c, M26c, 1-53)

232-M. (German.) **Rolling and Recrystallization Textures of an Iron-Nickel Alloy With 30% Ni.** Johanna Grewen, Armin Segmuller and Gunter Wassermann. *Archiv für das Eisenhüttenwesen,* v. 29, Feb. 1958, p. 119-124.

In rolled plate the characteristic cubic texture was not found while in recrystallized plate the cubic texture appeared at 500° C. At increasing annealing time and temperature the cubic texture became more apparent. Another main orientation appeared in the original rolling direction. This orientation deviated from the Spinell twin orientation by 8° (angle). 30 ref.
(M26c, N5; Fe, *Ni*)

233-M. (German.) **Electron Microscope Observations of Stacking Defects During Crystal Growth of Iron Nitride Films.** Wolfgang Pitsch. *Archiv für das Eisenhüttenwesen,* v. 29, Feb. 1958, p. 125-128.

Iron nitride films were observed with direct beam under an electron microscope. In face-centered cubic gamma nitride layers interference images of stacking defects were obtained and their orientation in various {111} plains is discussed. On hexagonal epsilon nitride layers no such stacking defects were found, since their formation requires too much energy. 8 ref.

250-M. **Electroshaping of Copper Single Crystals.** D. H. Avery, M. L. Ebner and W. A. Backofen. *AIME Transactions,* v. 212, Apr. 1958, p. 256-259.

Procedure of accelerated electropolishing to prepare a gage section in cylindrical single-crystal Cu specimens for fatigue studies. Surface produced is both polished and dimensionally accurate to ± 0.001 in. with no distortion being evidenced in back-reflection photograms of the Laue type. Time for shaping is substantially less than that required for acid cutting. (M20p, Q7, 1-60; Cu, 14-61)

251-M. **The Effect of Dissolved Tin on the Lattice Parameter of Copper.** A. F. Andresen. *AIME Transactions,* v. 212, Apr. 1958, p. 259-260.

252-M.* **The Modification of Aluminum-Silicon Alloys by Sodium.** R. C. Plumb and J. E. Lewis. *Institute of Metals, Journal,* v. 86, Apr. 1958, p. 393-400.

Measurements by autoradiography and activation analysis revealed the distribution of Na in the microstructures of 7.5% Si aluminum alloys modified by the addition of various amounts of Na. Electron microscope studies indicate that there is no fundamental difference be-

tween modification by chill casting and modification by Na addition. 12 ref. (M27d; Al-b, *Si, Na*)

253-M. Arrangements of Dislocations in Plastically Bent Silicon Crystals. J. R. Patel. *Journal of Applied Physics,* v. 29, Feb. 1958, p. 170-175.

Single crystals of silicon were plastically bent at an elevated temperature. The average etch-pit density after deformation is approximately two to three times higher than the calculated dislocation density. Prolonged annealing close to the melting point results in polygonization or the alinement of etch pits perpendicular to the active slip planes. Satisfactory agreement was obtained between the densities of etch pits in the annealed and polygonized specimens and the predicted dislocation densities. 14 ref. (M26b; Si, 14-61)

254-M. Thermally Precipitated Phases and Their Distribution in an Aluminum-Silicon-Cadmium Alloy. R. E. Marburger and A. W. Schluchter. *Journal of Applied Physics,* v. 29, Feb. 1958, p. 184-188.

X-ray and electron diffraction and electron microscopy used to study the composition and distribution of the precipitated phases in a 4% Si, 1% Cd aluminum alloy as a function of thermal history. Thin precipitated crystallites detected in extraction replicas of specimens tempered above 400° F. and identified as elemental Si by selected area electron diffraction. (M24c, N7; Al, *Cd, Si*)

Orientation of grain boundaries is connected with the amount of precipitation along the boundaries. This has been previously proven on material with preferred orientation axes, such as fiber-type textures. In random structures in 1.8% Be alloys, a relationship between precipitation and orientation of two adjacent crystals was found. Strength of precipitation increases with increasing orientation angle. 15 ref. (M27f, N7; Cu-b, *Be*)

302-M. (German.) **The Phase Diagrams of the Systems Gallium-Cadmium and Gallium-Zinc.** Theo Heumann and Bruno Predel. *Zeitschrift für Metallkunde,* v. 49, Feb. 1958, p. 90-95.
